MISSION, VISION AND VALUES

UFI'S MISSION

UFI Filters' mission is to create innovative and sustainable solutions in filtration and thermal management systems. UFI Filters puts customers first and aims to provide them with exceptional quality products to enhance the efficiency of their applications.

UFI Filters believes in a business ethic of continuous improvement and mutual respect, which begins inside the Company and extends to customers and suppliers with equal importance.

UFI'S VISION

Be the trendsetter in the world of filtration, hydraulic applications included, and thermal management.

UFI'S VALUES

The "Values" of ethical conduct adopted by UFI Group and shared throughout its entire organization are:

INNOVATION
Being one step ahead

PASSION
Being driven by passion and heart

EXCELLENCE
Delivering superior results, so that we are always chosen by the best

INTEGRITY
Operating in adherence to moral and ethical principles

ACCOUNTABILITY
Achieving our goals respecting our values

DIVERSITY
Appreciating and valuing our differences

A WINNING GROUP

A SUCCESS STORY SINCE 1971

UFI Filters, was founded in Nogarole Rocca, in Italy, in 1971 as a supplier of filtration systems for the automotive market. Some 10 years later, the Sofima brand was created to exploit the distribution potential in the Italian aftermarket. At the same time, the company began working with the most important Formula 1 teams, becoming a supplier of specific, tailor-made solutions guaranteeing top performance and taking the teams to the top of the championships.

In the 1990s, thanks to the vision and growth goals of its owners, UFI Filters began to expand its boundaries into new product development and new world markets.

In 1992, Planet Filters S.p.A. was established in Bolgare, near Bergamo, starting production of filtration solutions with the brands of UFI Hydraulic Division and SOFIMA Hydraulic Division for the hydraulic sector.

In 1996, being the first European filtration company to enter the Chinese market, UFI opened the first of its now four plants in China.

The late '90s was a time of notable growth, with the company winning over car manufacturers with fuel filters that guaranteed the separation of water from diesel.

At the start of the new millennium, it became a supplier to the demanding German car manufacturers, providing not only fuel but also oil and air modules, and thus reinforcing its reputation as a global Original Equipment supplier to the world's leading car manufacturers. In 2010, UFI entered the world of heat exchangers, specializing in the design, development and production of vacuum-brazed aluminium water-cooled heat exchangers. Today, 6 of the 7 biggest automotive groups in the world work with UFI to develop complete filtration and lubrication systems.

The results obtained by the company can be attributed to the constant investment in research and development (over 5% of turnover), allowing UFI to come up with innovative, exclusive solutions for its customers. Over the years, UFI has registered 167 patents.

The UFI Innovation Centers in Italy, India and China are equipped with sophisticated, advanced research and analysis tools for developing new products and filtration materials. UFI Filters now has over 4000 employees at 14 production sites, 3 innovation centers and 54 commercial offices.

THE GROUP BY NUMBERS

1971

Founded in 1971, it's now a world leader in filtration technology and thermal management.

10

10 application sectors: from automotive (LV/HD), industry and hydraulics to special applications.

4.000

14 production plants and over 4,000 employees in 16 countries worldwide.

F1

Present everywhere, from F1 cars to the ExoMars spacecraft.

95%

95% of vehicles manufacturers worldwide choose UFI Filters.

120

120 specialised technicians in the innovation and development centers in Italy and China.

167

167 patents at international level.

5%

5% of turnover reinvested in R&D.

6

6 lines of filters supplied: air, oil, fuel, cabin air, hydraulics and transmission.

150

150 co-branded products with the biggest OEM's.

HYDRAULIC DIVISION

MOBILE HYDRAULIC APPLICATIONS

The supply of reliable hydraulic power to vehicles serving the arduous requirements of the construction industry safeguards vehicle utilization and productivity levels and avoids the expensive, time-consuming issues associated with un-planned downtime, maintenance and repair.

When properly protected against contamination, the components of the hydraulic-circuit enable vehicle fluidpower systems to achieve incredible displays of power and agility in a vast array of applications and working environments. For this reason, Filtration Quality is essential as most hydraulic failures are a result of particulate contamination.

UFI Hydraulic Division has the knowledge and engineering technology to confront and master these issues with a proven range of filtration products for the mobile customer. Many well-known construction-vehicle manufacturers and end users have placed their trust in UFI's ability for many years, both in Original Equipment and in Aftermarket.

STATIONARY HYDRAULIC APPLICATIONS

Backed by its recognized Industrial pedigree, UFI Hydraulic Division has earned a solid reputation for quality and cost-efficient products also for CNC machines, presses, windmill applications and industrial hydraulic systems.

UFI Hydraulic Division filters meet the hydraulic-system requirements of maximum protection, with high efficiency and constant stability.

High-performance micro-fibre filtration media, with high voids-volume, warrants validated levels of dirt-holding capacity, coherent with the economic extended machine-life service-intervals demanded by the market. There is no evidence that oil can exceed a certain level of cleanliness and therefore Filtration Quality should be as efficient as space, costs and pressure-drop will allow.

NUMBERS AND SECTORS

1992

Founded in 1992, it's now a world leader in hydraulic technology.

6

6 application sectors: from heavy duty, industry and power generation to special applications.

150

3 production plants and over 150 employees in 6 countries worldwide.

6

6 lines of filter supplied: suction, return, pressure, off-line, transmissions, air.

HEAVY DUTY
Trucks, buses, road building machines etc.

AGRICULTURAL
Tractors, combined harvesters, mixers, sprayers etc.

CONSTRUCTION
Excavators, backhoe loaders, dumpers, telehandlers etc.

POWER GENERATION
Wind turbines, genset, oil & gas etc.

MATERIAL HANDLING
Forklifts, port machining, vertical lifts etc.

INDUSTRIAL
Primary metal, ceramic presses, plastic presses, etc.

SUCTION FILTERS

OPTIMAL PROTECTION OF YOUR PUMP

Application:
Suction filters are required for general purpose coarse filtration protection of the downstream hydraulic-pump.
Fine filtration at this point in the hydraulic circuit is not recommended to avoid pump-cavitation.

User Benefits:
Suction filters represent the “first-line” filtration and are used to:

- avoid the ingress of contamination into the hydraulic circuit
- prolong the lifetime of finer downstream filtration
- reduce the particulate-load on the finer filter, thus extending service-life-intervals, unplanned downtime and maintenance
- avoid damage to the finer downstream filter from coarse particulate, such as rust.

The overall consequence of effective “first-line” suction filtration is a reduction in the Kwh running costs of the hydraulic-pump.

CAL
SUCTION FILTERS

MATERIALS

Housing: Zinc plated steel

FLOW RATE

Up to 100 l/min

WORKING TEMPERATURE

From -25° to +110° C

COMPATIBILITY (ISO 2943)

Full with fluids: HH-HL-HM-HV-HTG
(according to ISO 6743/4)
For fluids different than the above mentioned, please contact our Customer Service.

MAINTENANCE

The best time to change your filter element is just before it reaches its maximum dirt-holding capacity. When it is time to change the filter element, switch off the system before opening the tank.
Remove the dirty filter element and replace it with an original UFI element, verifying the part number on the filter cap or on the catalogue.
Close the tank.
We recommend the stocking of a spare UFI filter element for timely replacement when required.

MAINTENANCE

The best time to change your filter element is just before it reaches its maximum dirt-holding capacity. For this reason, we recommend to monitor the pressure of the hydraulic oil flowing through the filter with a clogging indicator. When it is time to change the filter element, switch off the system before opening the filter housing and make sure there is no pressure in the filter. Unscrew the bowl and remove the dirty filter element. Clean the bowl; check the gaskets conditions and replace if necessary. Replace the filter element with an original UFI element, verifying the part number on the filter label or on the catalogue.
Replace the bowl in contact with the head gasket. Screw the upper tie-rod until the bowl is completely locked on the head ensuring the seal.
We recommend the stocking of a spare UFI filter element for timely replacement when required.

N.B.

All the curves have been obtained with mineral oil having a kinematic viscosity 30 cSt and specific gravity 0,86 kg/dm3; for fluids with different features, please consider the factors described in the first part of this catalogue. All the curves are obtained from test done at the UFI HYDRAULIC DIVISION Laboratory, according to the specification ISO 3968. In case of discrepancy, please check the contamination level, viscosity and features of the fluid in use.

FSC-FSB
SUCTION FILTERS

MATERIALS

Housing: Aluminium alloy
FSC31 & FSC41
Cover & head: Aluminium alloy
Bowl: Polyammide
FSC71 & FSC81
Cover & housing: Aluminium
FSC51 & FSC61
Housing: Steel
Cover: Aluminium
Shut-off valve: Polyammide
Seals: NBR Nitrile
(FKM - on request fluoroelastomer)
Indicator housing: Brass

PRESSURE

Collapse, differential for the filter element (ISO 2941): 100 kPa (1 bar)

WORKING TEMPERATURE

From -25° to +110° C

COMPATIBILITY (ISO 2943)

Full with fluids: HH-HL-HM-HV-HTG
(according to ISO 6743/4)
For fluids different than the above mentioned,
please contact our Customer Service.

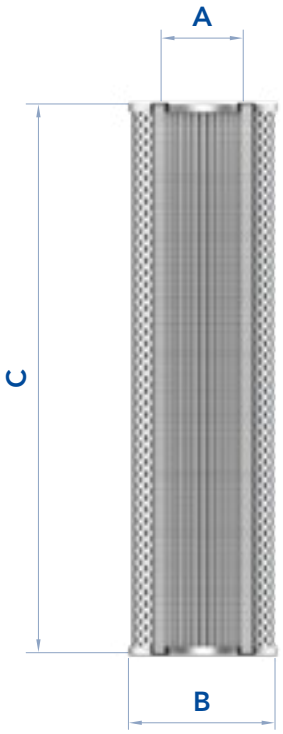
MAINTENANCE

The best time to change your filter element is just before it reaches its maximum dirt-holding capacity. For this reason, we recommend to monitor the pressure of the hydraulic oil flowing through the filter with a clogging indicator. When it is time to change the filter element, switch off the system before opening the filter housing.
Unscrew the tie rod, unscrew the cover of the filter head and remove the dirty filter element. Replace it with an original UFI element, verifying the part number on the filter label or on the catalogue. Check the gaskets conditions and replace if necessary. Insert the clean element, handling with care and cleanliness. Replace the cover on the filter head with the screw and screw the tie rod until it stops.
We recommend the stocking of a spare UFI filter element for timely replacement when required.



FILTER ELEMENT

	A	B	C	KG	AREA (cm²) Media M+

MAINTENANCE

The best time to change your filter element is just before it reaches its maximum dirt-holding capacity. For this reason, we recommend to monitor the pressure of the hydraulic oil flowing through the filter with a clogging indicator. When it is time to change the filter element, switch off the system.
Unscrew the cover and remove it. If the filter has a by-pass valve, don't touch it.

Remove the dirty filter element using the upper handle. Replace it with an original UFI element, verifying the part number on the filter label or on the catalogue. Lubricate the gaskets for an optimal assembly. Position the cover carefully to ensure the seal on the filter element. Tighten the screws with the washers until it stops.
We recommend the stocking of a spare UFI filter element for timely replacement when required.

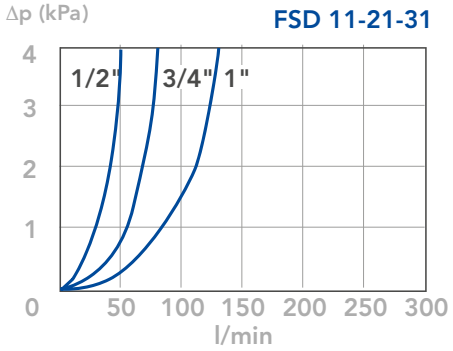
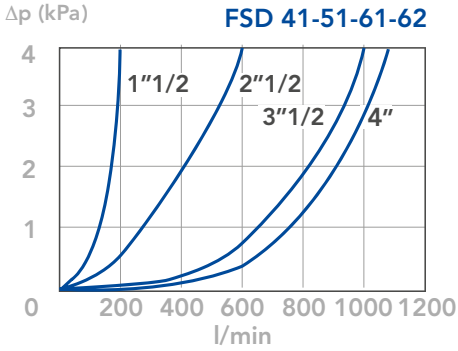
PRESSURE DROP CURVES (ΔP)

The Pressure Drop (Δp) must be lower than 3 kPa (0,03 bar).

FILTER HOUSING PRESSURE DROP
(mainly depending on the port size)

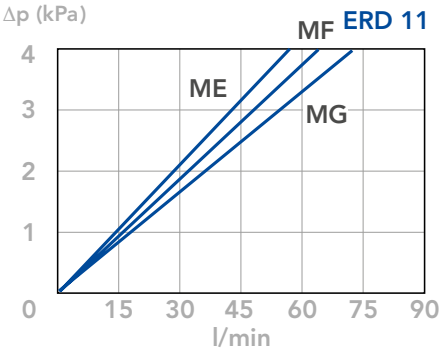


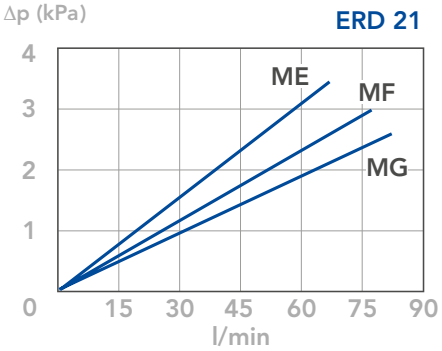


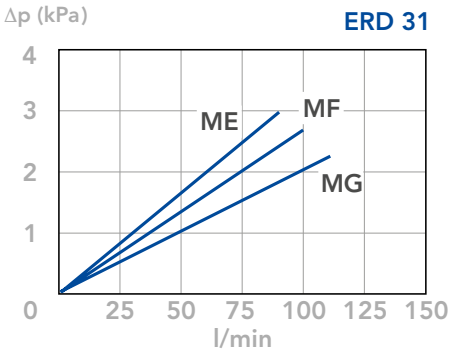
N.B.

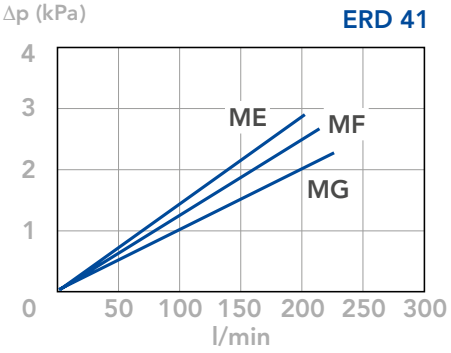
All the curves have been obtained with mineral oil having a kinematic viscosity 30 cSt and specific gravity 0,86 kg/dm3; for fluids with different features, please consider the factors described in the first part of this catalogue. All the curves are obtained from test done at the UFI HYDRAULIC DIVISION Laboratory, according to the specification ISO 3968. In case of discrepancy, please check the contamination level, viscosity and features of the fluid in use.

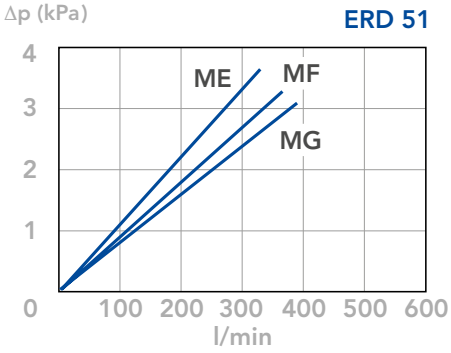
CLEAN FILTER ELEMENT PRESSURE DROP
WITH M+ MEDIA
(depending both on the internal diameter
of the element and on the filter media)

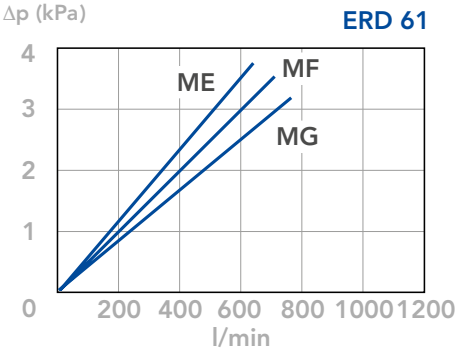


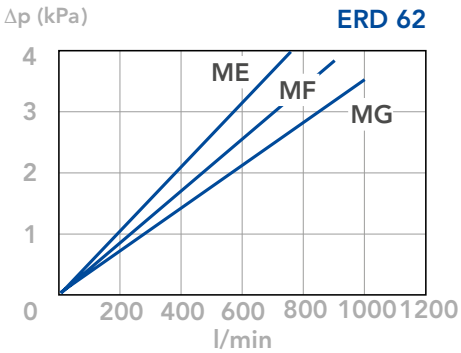












N.B.

All the curves have been obtained with mineral oil having a kinematic viscosity 30 cSt and specific gravity 0,86 kg/dm3; for fluids with different features, please consider the factors described in the first part of this catalogue. All the curves are obtained from test done at the UFI HYDRAULIC DIVISION Laboratory, according to the specification ISO 3968. In case of discrepancy, please check the contamination level, viscosity and features of the fluid in use.

FSD-MSE
SUCTION FILTERS

BYPASS VALVE PRESSURE DROP

When selecting the filter size, these curves must be taken into account if it is foreseen that any flow peak is to be absorbed by the bypass valve, it also must be of proper configuration to avoid pressure peaks. The valve pressure drop is directly proportional to fluid specific gravity.

SUCTION FILTERS

MAINTENANCE

The best time to change your filter element is just before it reaches its maximum dirt-holding capacity. For this reason, we recommend to monitor the pressure of the hydraulic oil flowing through the filter with a clogging indicator. When it is time to change the filter element, switch off the system. Remove the dirty filter element. Replace it with an original UFI element, verifying the part number on the filter label or on the catalogue. Lubricate the spin-on gasket, screw on the head until it stops and tighten by turning it 3/4 of a turn.
We recommend the stocking of a spare UFI filter element for timely replacement when required.

FILTER ELEMENT

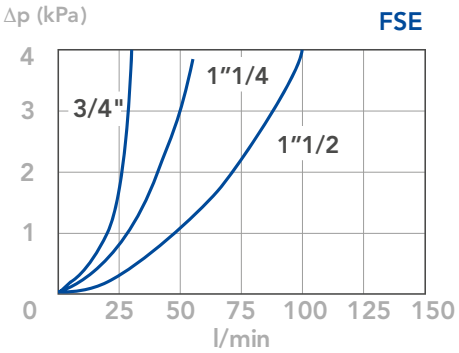
					AREA (cm²)	
	A	B	C	KG	Media M+	Media C+
ESE11 CCA151	96,5	3/4" BSP	146	0,70	980	3.305
ESE12 CCA152	96,5	3/4" BSP	191	0,80	1.390	4.745
ESE21 CCA301	129	1"1/4 BSP	181	1,20	1.940	5.560
ESE22 CCA302	129	1"1/4 BSP	226	1,40	2.570	7.360

The used filter elements cannot be cleaned and are classified as “Dangerous waste material”. They must be disposed according to local laws by authorized Companies.
Verify that the Company you choose has the expertise and authorization to dispose this type of waste material.

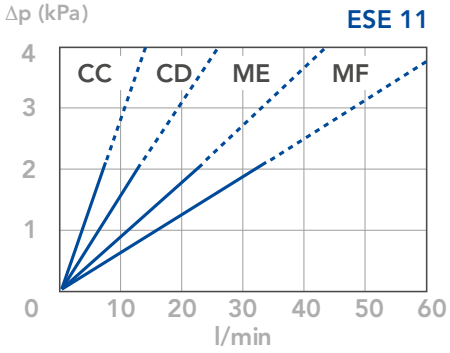
PRESSURE DROP CURVES (ΔP)

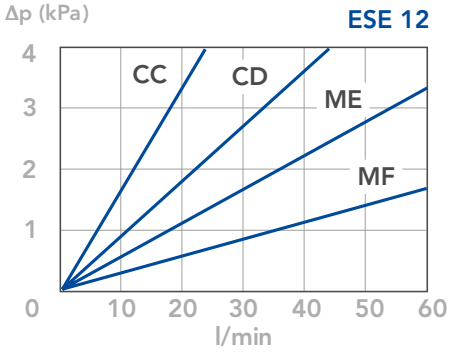
The “Assembly Pressure Drop (Δp)” is obtained by adding the pressure drop values of the Filter Housing and of the Clean Filter Element corresponding to the considered Flow Rate and it must be lower than 3 kPa (0,03 bar)

FILTER HOUSING PRESSURE DROP
(mainly depending on the port size)



CLEAN FILTER ELEMENT PRESSURE DROP WITH M+ MEDIA
(depending both on the internal diameter of the element and on the filter media)



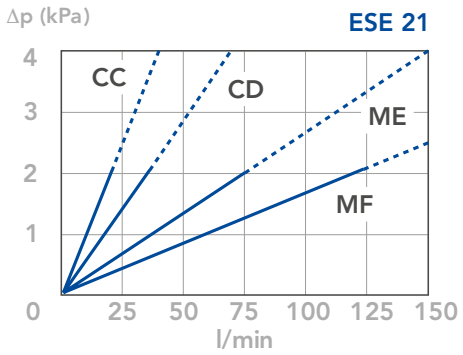


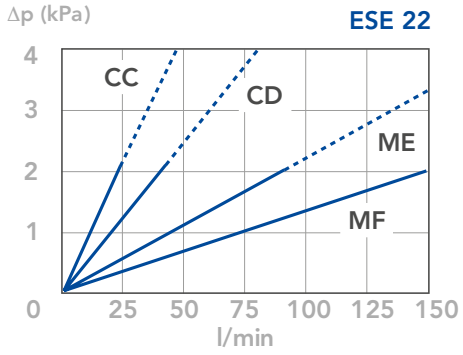
N.B.

All the curves have been obtained with mineral oil having a kinematic viscosity 30 cSt and specific gravity 0,86 kg/dm3; for fluids with different features, please consider the factors described in the first part of this catalogue. All the curves are obtained from test done at the UFI HYDRAULIC DIVISION Laboratory, according to the specification ISO 3968. In case of discrepancy, please check the contamination level, viscosity and features of the fluid in use.

FSE-AMF
SUCTION FILTERS

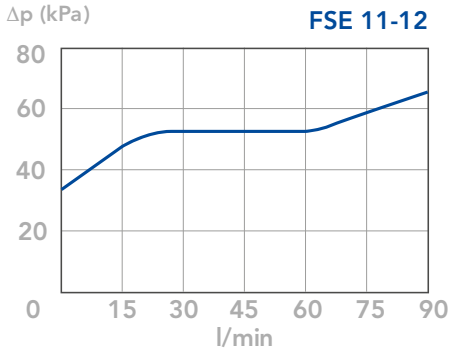
FSE3+ and FSE4+ filters use double element canisters. The Assembly Pres-sure Drop is therefore determined by adding the Housing Pressure Drop at the real flow rate and half the pressure drop of the ESE2+ element. E.g. The pressure drop of a complete FSE31-----FC--- filter at a 60 l/min flow rate is obtained by adding the Housing Pressure Drop and half the ESE21NFC element pressure drop at 60 l/min

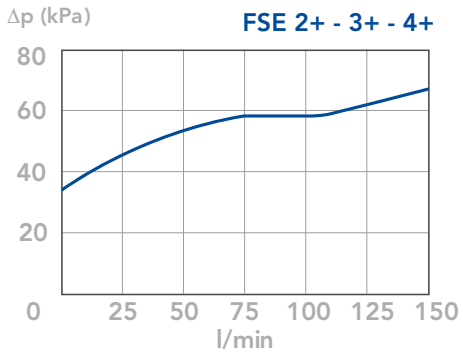




BYPASS VALVE PRESSURE DROP

When selecting the filter size, these curves must be taken into account if it is foreseen that any flow peak is to be absorbed by the bypass valve, it also must be of proper configuration to avoid pressure peaks. The valve pressure drop is directly proportional to fluid specific gravity.





N.B.

All the curves have been obtained with mineral oil having a kinematic viscosity 30 cSt and specific gravity 0,86 kg/dm3; for fluids with different features, please consider the factors described in the first part of this catalogue. All the curves are obtained from test done at the UFI HYDRAULIC DIVISION Laboratory, according to the specification ISO 3968. In case of discrepancy, please check the contamination level, viscosity and features of the fluid in use.

PRESSURE FILTERS

MAIN-LINE, HIGH EFFICIENCY FILTRATION

Application:
Ufi pressure filters are generally used for the following applications: hydraulic Transmission and power-steering applications, general main-line, open-loop pressure filters for full-flow hydraulic system conditions.

User Benefits:
- main-line, high-efficiency, full-flow fine filtration for the protection of precision valves and fluid-power proportional controls.
- high-performance, high-dirt-holding capacity, micro-fibre filter elements keep the cost of ownership (running-costs) low between planned vehicle service-intervals
- non-welded housing design for extended life and safer operation.

FPA-MDM
PRESSURE FILTERS

MATERIALS

Housing: Anodized aluminium alloy
Bypass valve: Brass
Seals: NBR Nitrile (FKM Fluoroelastomer - on request)

MAINTENANCE

The best time to change your filter element is just before it reaches its maximum dirt-holding capacity. For this reason, we recommend to monitor the pressure of the hydraulic oil flowing through the filter with a clogging indicator. When it is time to change the filter element, switch off the system before opening the filter housing and make sure there is no pressure in the filter. Unscrew the bowl and remove the dirty filter element. Replace it with an original UFI element, verifying the part number on the filter label or on the catalogue. Clean the bowl; check the gaskets conditions and replace if necessary. Insert the clean element into his seat, handling with care and cleanliness. Screw the housing until it stops, with a tightening torque of 50 Nm +5/0.
We recommend the stocking of a spare UFI filter element for timely replacement when required.
N.B. The used filter elements cannot be cleaned and are classified as "Dangerous waste material": they must be disposed according to the local laws by authorized Companies.

FILTER ELEMENT

	A	B	C	Kg	AREA (cm^2) Media F+
EPA11 CDM101	22	42	91	0,15	295
EPA12 CDM102	22	42	179	0,25	600

The used filter elements cannot be cleaned and are classified as "Dangerous waste material". They must be disposed according to local laws by authorized Companies.
Verify that the Company you choose has the expertise and authorization to dispose this type of waste material.

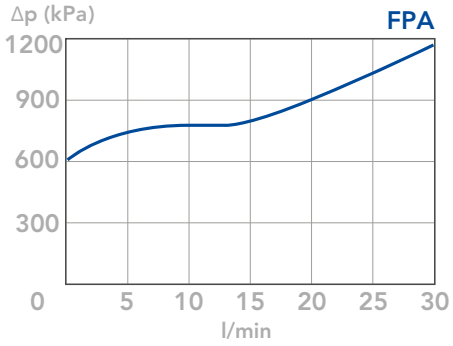
FPA-MDM
PRESSURE FILTERS

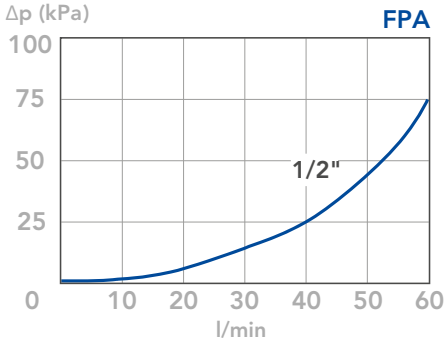
PRESSURE DROP CURVES (ΔP)

The “Assembly Pressure Drop (Δp)” is obtained by adding the pressure drop values of the Filter Housing and of the Clean Filter Element corresponding to the considered Flow Rate and it must be lower than 80 kPa (0,8 bar) and should never exceed 1/3 of the bypass valve setting.

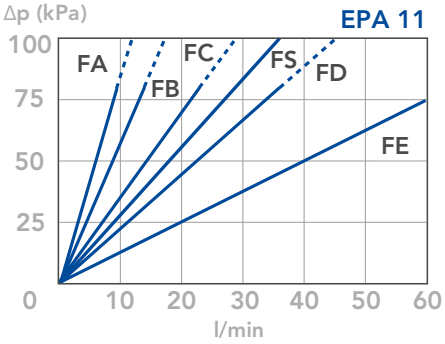
BYPASS VALVE PRESSURE DROP
When selecting the filter size, these curves must be taken into account if it is foreseen that any flow peak is to be absorbed by the bypass valve, it also must be of proper configuration to avoid pressure peaks. The valve pressure drop is directly proportional to fluid specific gravity.

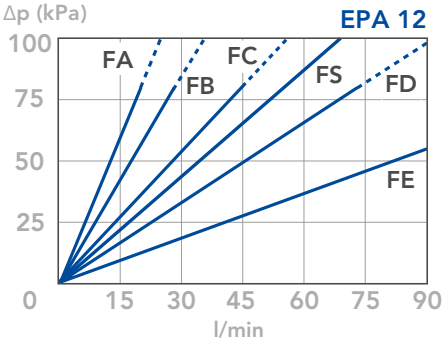
FILTER HOUSING PRESSURE DROP
(mainly depending on the port size)





CLEAN FILTER ELEMENT PRESSURE DROP WITH F+ MEDIA
(depending both on the internal diameter of the element and on the filter media)





N.B.

All the curves have been obtained with mineral oil having a kinematic viscosity 30 cSt and specific gravity 0,86 Kg/dm3; for fluids with different features, please consider the factors described in the first part of this catalogue. All the curves are obtained from test done at the UFI HYDRAULIC DIVISION Laboratory, according to the specification ISO 3968. In case of discrepancy, please check the contamination level, viscosity and features of the fluid in use.

FPB-MHT
PRESSURE FILTERS

MATERIALS

Head: Cast iron
Bowl: Steel
Bypass valve: Steel
Seals: NBR Nitrile (FKM - on request fluoroelastomer)
Indicator housing: Brass

PRESSURE

Max working: 42 MPa (420 bar)
Collapse, differential for the filter element (ISO 2941):
series standard 2 MPa (20 bar)
series H+ 21 MPa (210 bar)

BYPASS VALVE

Setting: 600 kPa (6 bar) ± 10%

WORKING TEMPERATURE

From -25° to +110° C

COMPATIBILITY (ISO 2943)

Full with fluids: HH-HL-HM-HV-HTG
(according to ISO 6743/4)
For fluids different than the above mentioned,
please contact our Customer Service

FPB-MHT
PRESSURE FILTERS

CLEAN FILTER ELEMENT PRESSURE DROP WITH F+ MEDIA
(depending both on the internal diameter of the element and on the filter media)

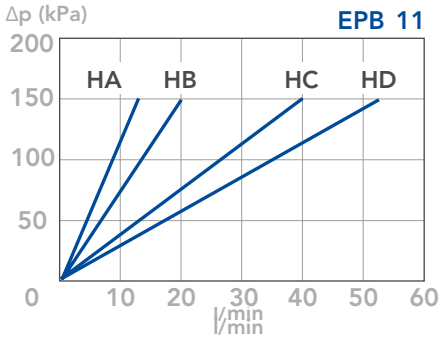
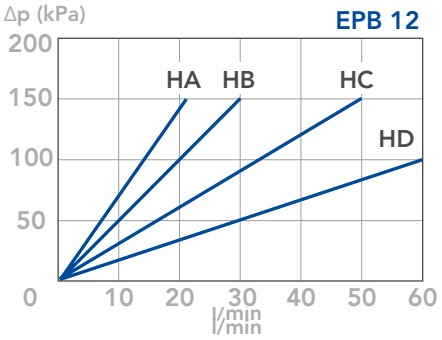
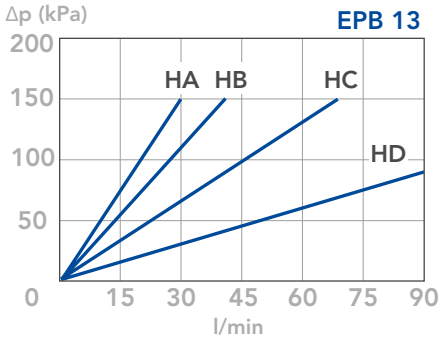
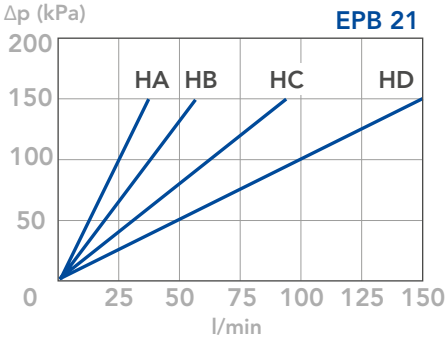
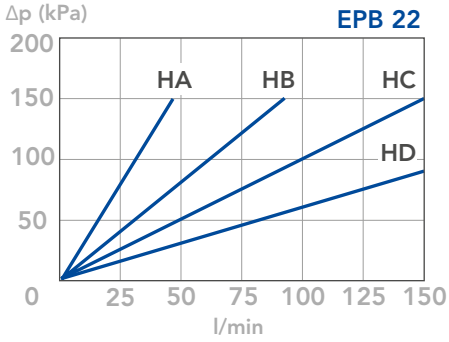
CLEAN FILTER ELEMENT PRESSURE DROP WITH H+ MEDIA
depending both on the internal diameter of the element and on the filter media) - Recommended with no bypass option

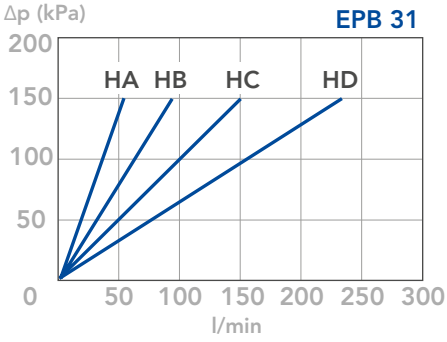


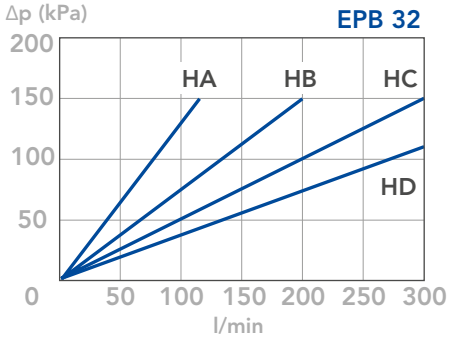


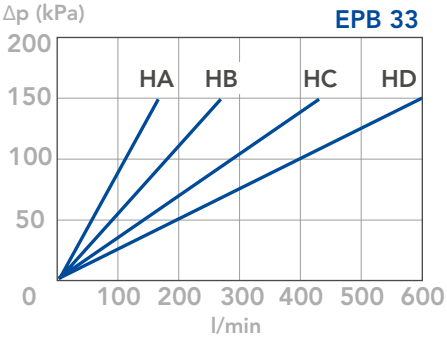






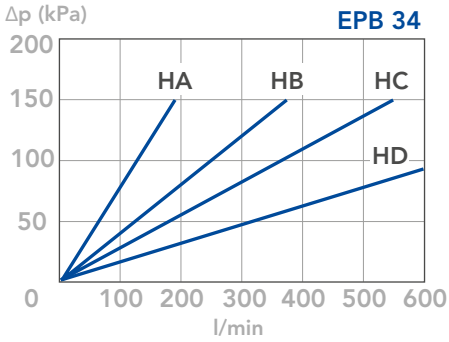


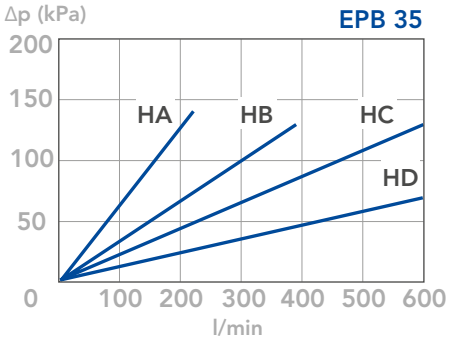




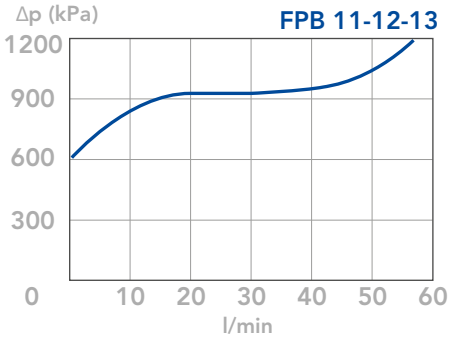
FPB-MHT
PRESSURE FILTERS

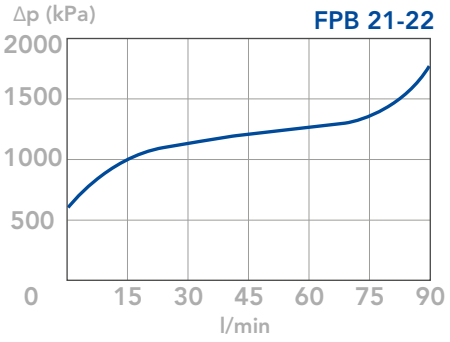
CLEAN FILTER ELEMENT PRESSURE DROP WITH H+ MEDIA
depending both on the internal diameter of the element and on the filter media) - Recommended with no bypass option

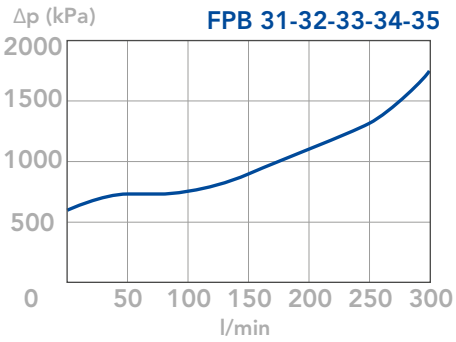




BYPASS VALVE PRESSURE DROP
When selecting the filter size, these curves must be taken into account if it is foreseen that any flow peak is to be absorbed by the bypass valve, it also must be of proper configuration to avoid pressure peaks. The valve pressure drop is directly proportional to fluid specific gravity.







REVERSE FLOW VALVE
For hydraulic systems where reverse flow can occur, the pressure filters series FPB2+ and FPB3+ are available with a free reverse flow valve allowing the fluid to pass through the filter element in the normal direction and to bypass the filter element in the reverse direction (option “R”).
The reverse flow valve is available also with incorporated bypass valve for the normal flow direction, set at 6 bar (option “P”).
In normal flow conditions the whole flow pass through the filter element. In the option “P”, if the differential pressure across the element exceeds 6 bar the bypass is activated.
In reverse flow conditions the flow bypasses the filter element.
Pressure drop through the valve in the reverse direction:
0,4 bar at 100 L/min
0,6 bar at 200 L/min
0,8 bar at 300 L/min

NORMAL FLOW

REVERSE FLOW

All the curves have been obtained with mineral oil having a kinematic viscosity 30 cSt and specific gravity 0,86 Kg/dm3; for fluids with different features, please consider the factors described in the first part of this catalogue. All the curves are obtained from test done at the UFI HYDRAULIC DIVISION Laboratory, according to the specification ISO 3968. In case of discrepancy, please check the contamination level, viscosity and features of the fluid in use.

FPC
PRESSURE FILTERS

MATERIALS

Head: Cast iron
Bowl: Steel
Bypass valve: Steel
Seals: NBR Nitrile
(FKM - on request fluoroelastomer)
Indicator housing: Brass

PRESSURE

Max working: 38,5 MPa (385 bar)
Collapse, differential for the filter element (ISO 2941):
series standard 2 MPa (20 bar)

BYPASS VALVE

Setting:
600 kPa (6 bar) ± 10%
350 kPa (3,5 bar)

WORKING TEMPERATURE

From -25° to +125° C

COMPATIBILITY (ISO 2943)

Full with fluids: HH-HL-HM-HV-HTG
(according to ISO 6743/4)
For fluids different than the above mentioned,
please contact our Customer Service.

PRESSURE FILTERS

MAINTENANCE

The best time to change your filter element is just before it reaches its maximum dirt-holding capacity. For this reason, we recommend to monitor the pressure of the hydraulic oil flowing through the filter with a clogging indicator. When it is time to change the filter element, switch off the system before opening the filter housing and make sure there is no pressure in the filter. Unscrew the bowl and remove the dirty filter element. Replace it with an original UFI element, verifying the part number on the filter label or on the catalogue. Clean the bowl; check the gaskets conditions and replace if necessary. Insert the clean element into his seat, handling with care and cleanliness. Screw the housing until it stops, with a tightening torque of 70 Nm +5/0.
We recommend the stocking of a spare UFI filter element for timely replacement when required.

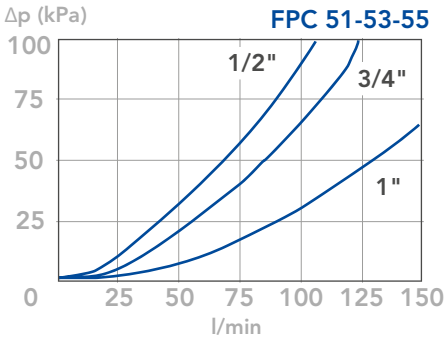
FILTER ELEMENT

	A	B	C	Kg Media F+	AREA (cm²) Media F+
EPC51	56,5	18	118	0,12	945
EPC53	56,5	18	166	0,15	1.401
EPC55	56,5	18	219	0,19	1.905

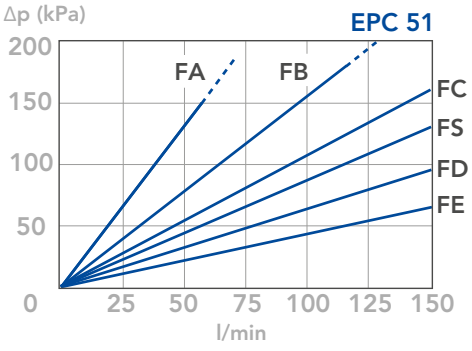
The used filter elements cannot be cleaned and are classified as “Dangerous waste material”. They must be disposed according to local laws by authorized Companies.
Verify that the Company you choose has the expertise and authorization to dispose this type of waste material.

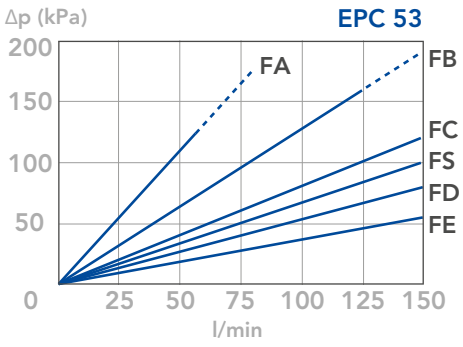
PRESSURE DROP CURVES (ΔP)

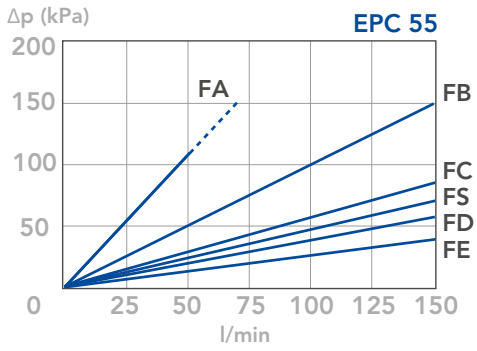
The “Assembly Pressure Drop (Δp)” is obtained by adding the pressure drop values of the Filter Housing and of the Clean Filter Element corresponding to the considered Flow Rate and it must be lower than 120 kPa (1,2 bar) and should never exceed 1/3 of the bypass valve setting.



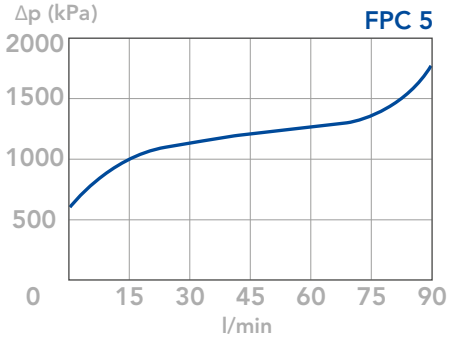
CLEAN FILTER ELEMENT PRESSURE DROP WITH F+ MEDIA
(depending both on the internal diameter of the element and on the filter media)







BYPASS VALVE PRESSURE DROP
When selecting the filter size, these curves must be taken into account if it is foreseen that any flow peak is to be absorbed by the bypass valve, it also must be of proper configuration to avoid pressure peaks. The valve pressure drop is directly proportional to fluid specific gravity.



N.B.

All the curves have been obtained with mineral oil having a kinematic viscosity 30 cSt and specific gravity 0,86 Kg/dm3; for fluids with different features, please consider the factors described in the first part of this catalogue. All the curves are obtained from test done at the UFI HYDRAULIC DIVISION Laboratory, according to the specification ISO 3968. In case of discrepancy, please check the contamination level, viscosity and features of the fluid in use.

MAINTENANCE

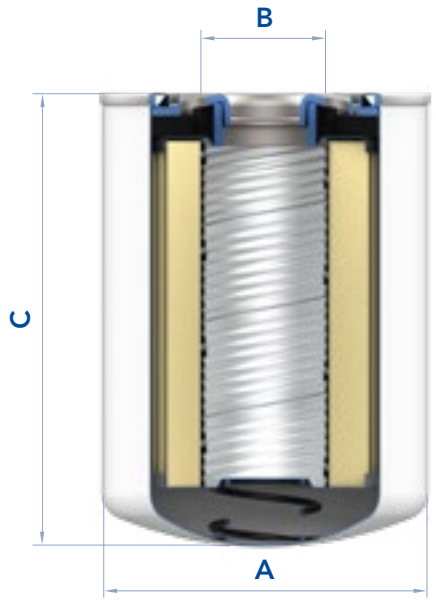
The best time to change your filter element is just before it reaches its maximum dirt-holding capacity. For this reason, we recommend to monitor the pressure of the hydraulic oil flowing through the filter with a clogging indicator. When it is time to change the filter element, switch off the system and make sure there is no pressure in the filter. Remove the dirty filter element. Replace it with an original UFI element, verifying the part number on the filter label or on the catalogue. Lubricate the spin-on gasket, screw on the head until it stops and tighten by turning it 3/4 of a turn

We recommend the stocking of a spare UFI filter element for timely replacement when required.

FPE-AMF-AMD

PRESSURE FILTERS



FILTER ELEMENT

	A	B	C	Kg	AREA (cm²) Media F+	AREA (cm²) MediaC+
ESE11 CCA151	96,5	3/4" BSP	146	0,70	2.140	3.305
ESE12 CCA152	96,5	3/4" BSP	191	0,80	3.630	4.745

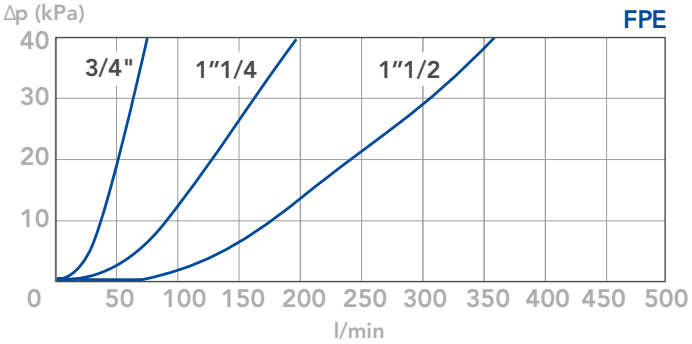
ESE22 CCA302	129	1"1/4 BSP	226	1,40	5.890	7.360

The used filter elements cannot be cleaned and are classified as "Dangerous waste material". They must be disposed according to local laws by authorized Companies.
Verify that the Company you choose has the expertise and authorization to dispose this type of waste material.

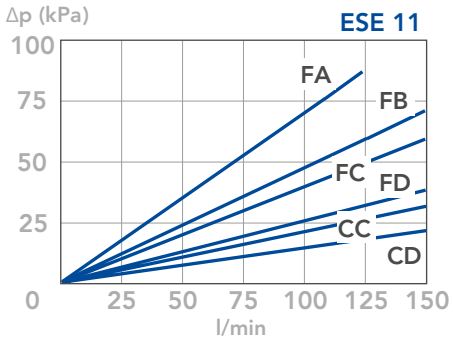
PRESSURE DROP CURVES (ΔP)

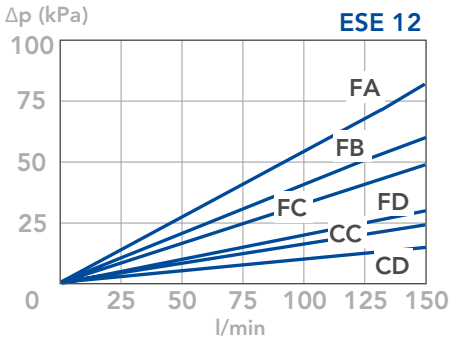
The "Assembly Pressure Drop (Δp)" is obtained by adding the pressure drop values of the Filter Housing and
of the Clean Filter Element corresponding to the considered Flow Rate and it must be lower than 50 kPa (0,5 bar) and should never exceed 1/3 of the bypass valve setting.

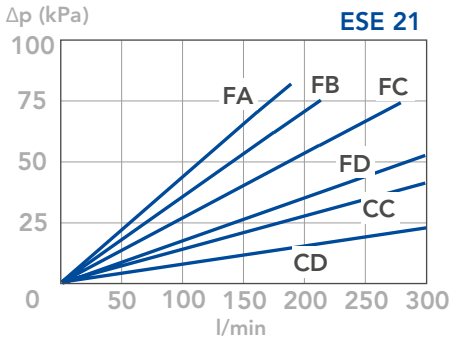
FILTER HOUSING PRESSURE DROP
(mainly depending on the port size)

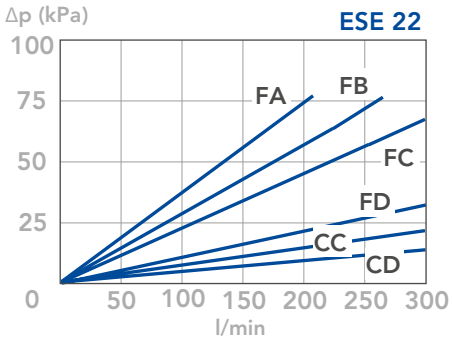


CLEAN FILTER ELEMENT PRESSURE DROP WITH F+ AND C+ MEDIA
(depending both on the internal diameter of the element and on the filter media)

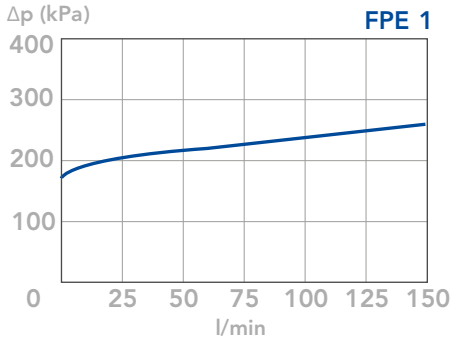


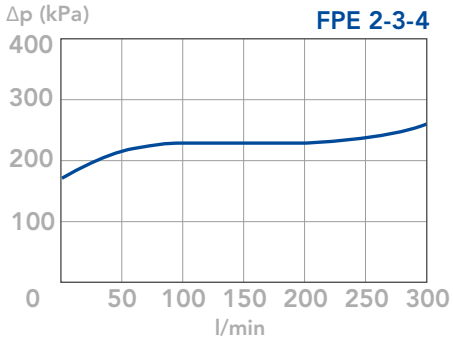






BYPASS VALVE PRESSURE DROP
When selecting the filter size, these curves must be taken into account if it is foreseen that any flow peak is to be absorbed by the bypass valve, it also must be of proper configuration to avoid pressure peaks. The valve pressure drop is directly proportional to fluid specific gravity.





N.B.

All the curves have been obtained with mineral oil having a kinematic viscosity 30 cSt and specific gravity 0,86 Kg/dm3; for fluids with different features, please consider the factors described in the first part of this catalogue. All the curves are obtained from test done at the UFI HYDRAULIC DIVISION Laboratory, according to the specification ISO 3968. In case of discrepancy, please check the contamination level, viscosity and features of the fluid in use.

FPG-MDS
PRESSURE FILTERS

MATERIALS

Head: Aluminium alloy
Bowl: Steel
Bypass valve: Steel
Seals: NBR Nitrile (FKM - on request fluoroelastomer)
Indicator housing: Brass

PRESSURE

Max working: 5 MPa (50 bar)
Collapse, differential for the filter element (ISO 2941):
1 MPa (10 bar)

BYPASS VALVE

Setting: 350 kPa (3,5 bar) ±10%

WORKING TEMPERATURE

From -25° to +110° C

COMPATIBILITY (ISO 2943)

Full with fluids: HH-HL-HM-HV-HTG
(according to ISO 6743/4)
For fluids different than the above mentioned,
please contact our Customer Service.

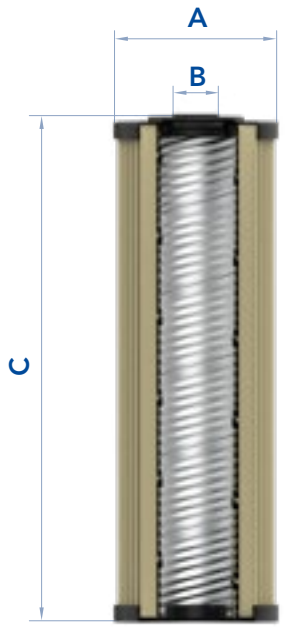
MAINTENANCE

The best time to change your filter element is just before it reaches its maximum dirt-holding capacity. For this reason, we recommend to monitor the pressure of the hydraulic oil flowing through the filter with a clogging indicator. When it is time to change the filter element, switch off the system before opening the filter housing and make sure there is no pressure in the filter. Unscrew the bowl and remove the dirty filter element. Replace it with an original UFI element, verifying the part number on the filter label or on the catalogue. Clean the bowl; check the gaskets conditions and replace if necessary. Insert the clean element into his seat, handling with care and cleanliness. Screw the housing until it stops, with a tightening torque of 50 Nm +5/0.
We recommend the stocking of a spare UFI filter element for timely replacement when required.



FILTER ELEMENT

MAINTENANCE

The best time to change your filter element is just before it reaches its maximum dirt-holding capacity. For this reason, we recommend to monitor the pressure of the hydraulic oil flowing through the filter with a clogging indicator. When it is time to change the filter element, switch off the system before opening the filter housing and make sure there is no pressure in the filter.
Unscrew the nuts and remove the inferior flange and the bowl. Remove the dirty filter element and hold the spring (do not throw it away). Replace the element with an original UFI, verifying the part number on the filter label or on the catalogue. Insert the clean element into his seat, handling with care and cleanliness. Check the gasket condition and replace if necessary. Place the spring on the bottom of the bowl. Place the bowl in contact with the head gasket. Place the inferior flange and screw the upper nuts until the bowl is completely locked on the head ensuring the seal.

We recommend the stocking of a spare UFI filter element for timely replacement when required.

FILTER ELEMENT

	A	B	C	Kg	AREA (cm^2) Media F+	Media M+
ERA31 CRE015	70	28	93	0,20	620	450

ERA52 CRE100	130	63	208	1,35	6.190	2.735

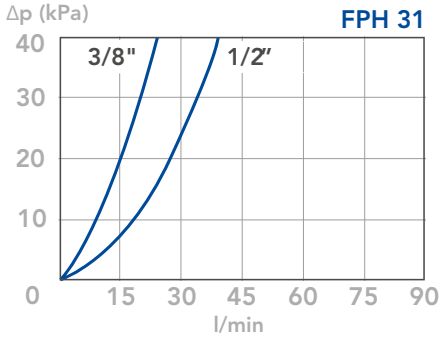
The used filter elements cannot be cleaned and are classified as “Dangerous waste material”. They must be disposed according to local laws by authorized Companies.
Verify that the Company you choose has the expertise and authorization to dispose this type of waste material.

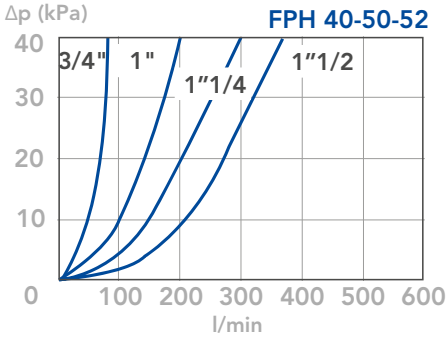
FPH-TLM
PRESSURE FILTERS

PRESSURE DROP CURVES (ΔP)

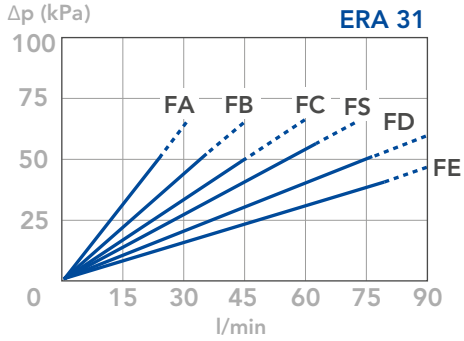
The “Assembly Pressure Drop (Δp)” is obtained by adding the pressure drop values of the Filter Housing and of the Clean Filter Element corresponding to the considered Flow Rate and it must be lower than 50 kPa (0,5 bar).

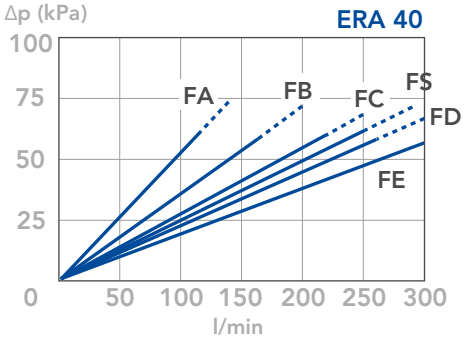
FILTER HOUSING PRESSURE DROP
(mainly depending on the port size)

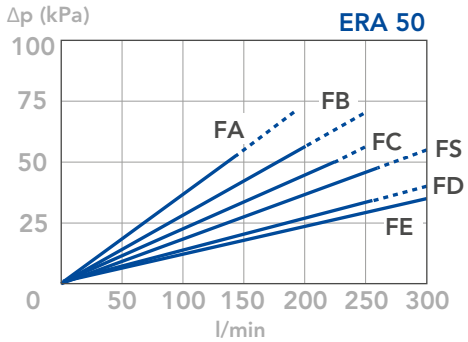


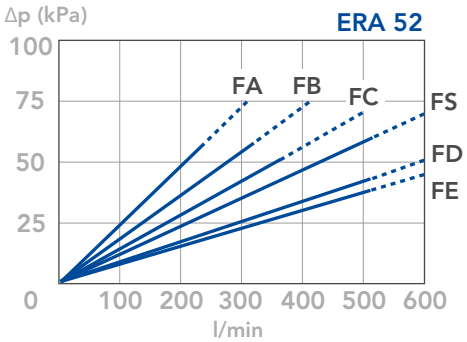


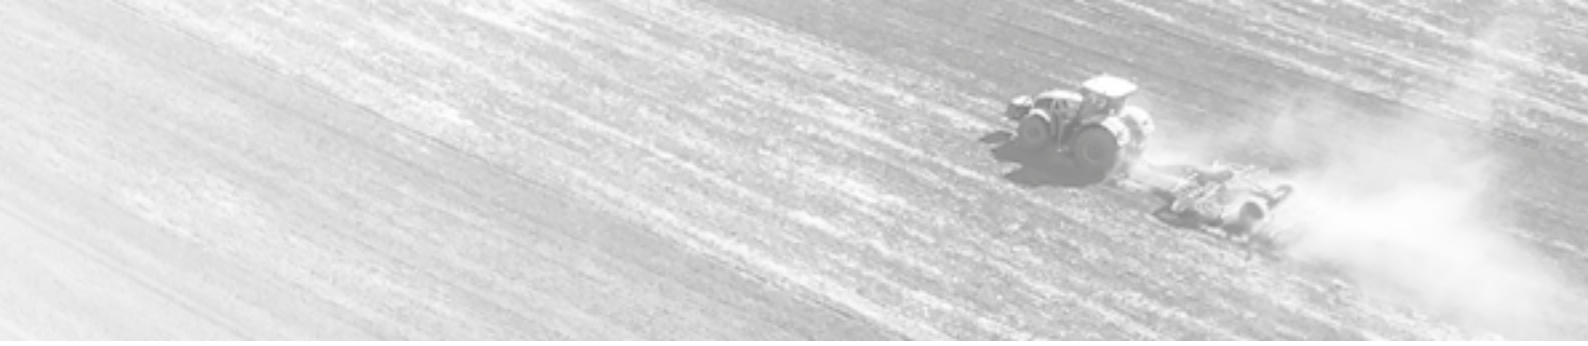
CLEAN FILTER ELEMENT PRESSURE DROP WITH F+ MEDIA
(depending both on the internal diameter of the element and on the filter media)





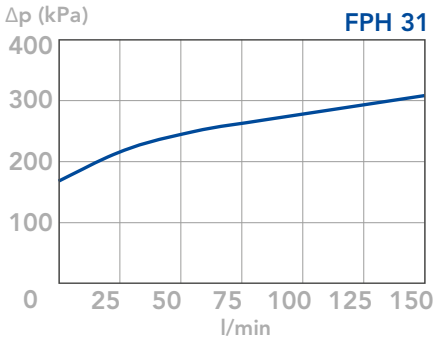


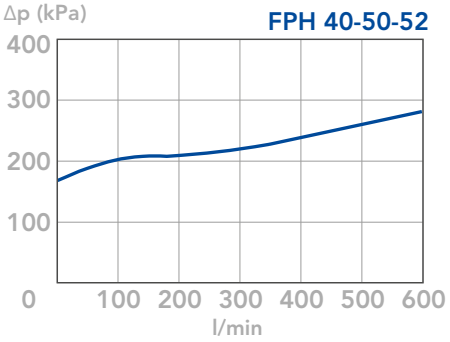




BYPASS VALVE PRESSURE DROP

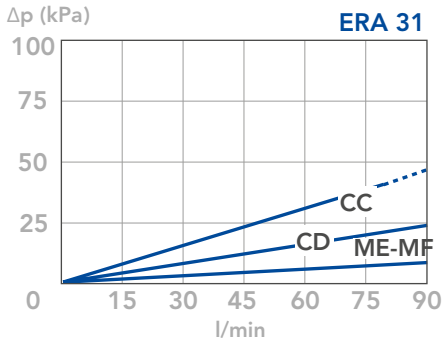
When selecting the filter size, these curves must be taken into account if it is foreseen that any flow peak is to be absorbed by the bypass valve, it also must be of proper configuration to avoid pressure peaks. The valve pressure drop is directly proportional to fluid specific gravity.

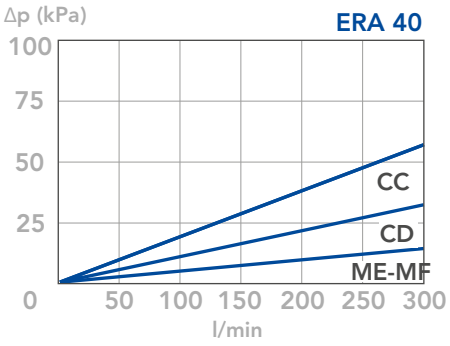


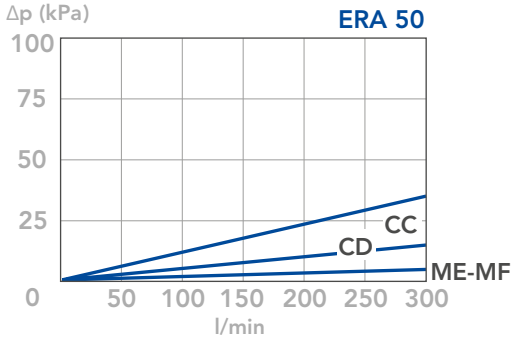


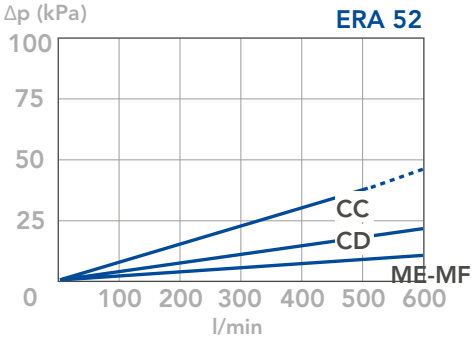
CLEAN FILTER ELEMENT PRESSURE DROP WITH C+ AND M+ MEDIA

(depending both on the internal diameter of the element and on the filter media)









N.B.

All the curves have been obtained with mineral oil having a kinematic viscosity 30 cSt and specific gravity 0,86 Kg/dm3; for fluids with different features, please consider the factors described in the first part of this catalogue. All the curves are obtained from test done at the UFI HYDRAULIC DIVISION Laboratory, according to the specification ISO 3968. In case of discrepancy, please check the contamination level, viscosity and features of the fluid in use.

FPL-SPP
PRESSURE FILTERS

MATERIALS

Head: Cast iron
Bowl: Steel
Bypass valve: Steel
Seals: NBR Nitrile
(FKM - on request fluoroelastomer)
Indicator housing: Brass

PRESSURE

Max working: 31,5 MPa (315 bar)
Collapse, differential for the filter element (ISO 2941)
standard series: 2 MPa (20 bar)
H+ series: 21 MPa (210 bar)

BYPASS VALVE

Setting: 600 kPa (6 bar) ± 10%

WORKING TEMPERATURE

From -25° to +110° C

COMPATIBILITY (ISO 2943)

Full with fluids: HH-HL-HM-HV-HTG
(according to ISO 6743/4)
For fluids different than the above mentioned,
please contact our Customer Service

MAINTENANCE

The best time to change your filter element is just before it reaches its maximum dirt-holding capacity. For this reason, we recommend to monitor the pressure of the hydraulic oil flowing through the filter with a clogging indicator. When it is time to change the filter element, switch off the system before opening the filter housing and make sure there is no pressure in the filter. Unscrew the bowl and remove the dirty filter element. Replace it with an original UFI element, verifying the part number on the filter label or on the catalogue. Clean the bowl; check the gaskets conditions and replace if necessary. Insert the clean element into his seat, handling with care and cleanliness. Screw the housing until it stops, with a tightening torque of 70 Nm +5/0.
We recommend the stocking of a spare UFI filter element for timely replacement when required.

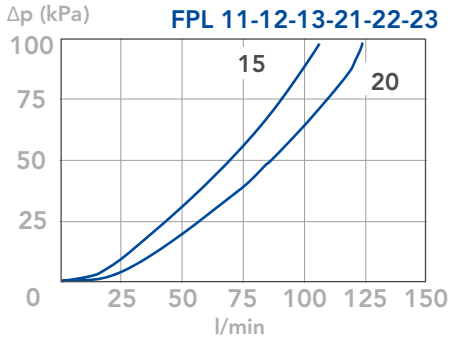
Verify that the Company you choose has the expertise and authorization to dispose this type of waste material.

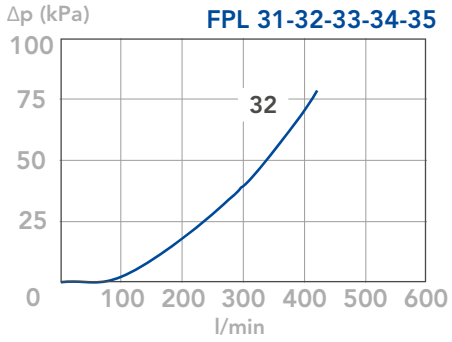
FPL-SPP
PRESSURE FILTERS

PRESSURE DROP CURVES (ΔP)

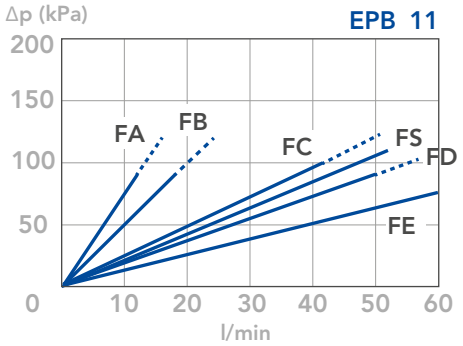
The “Assembly Pressure Drop (Δp)” is obtained by adding the pressure drop values of the Filter Housing and
of the Clean Filter Element corresponding to the considered Flow Rate and it must be lower than 120 kPa (1,2 bar) and should never exceed 1/3 of the bypass setting.

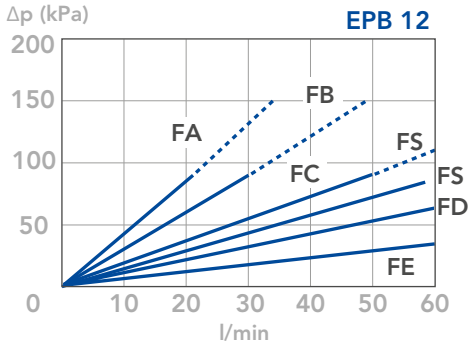
FILTER HOUSING PRESSURE DROP
(mainly depending on the port size)

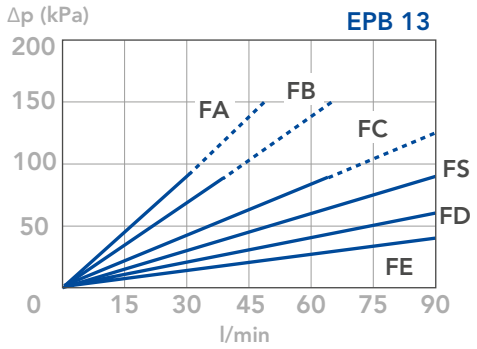


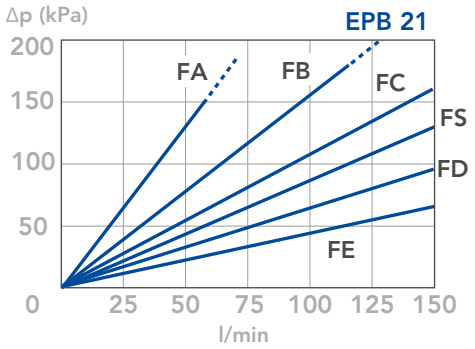


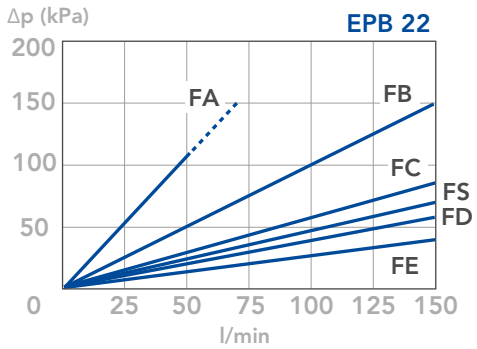
CLEAN FILTER ELEMENT PRESSURE DROP WITH F+ MEDIA
(depending both on the internal diameter of the element and on the filter media)

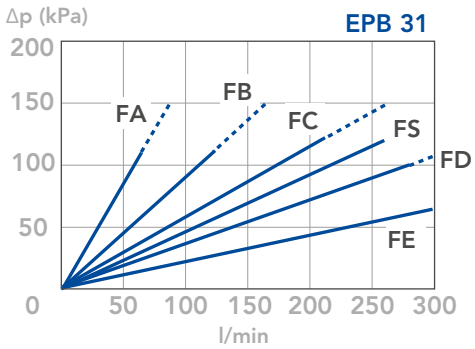


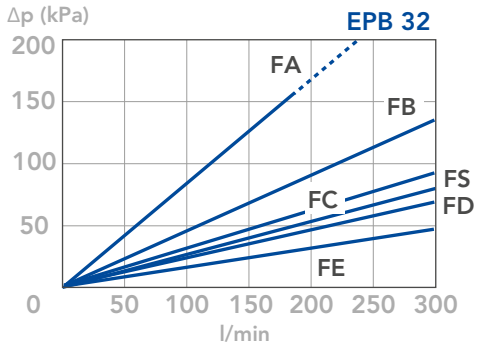


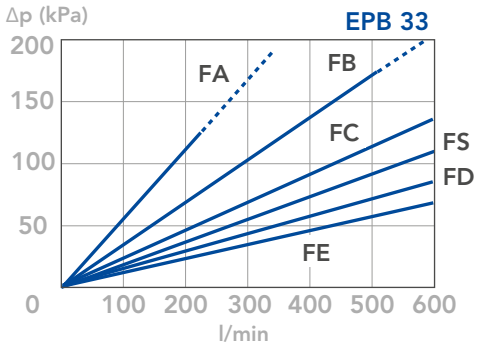


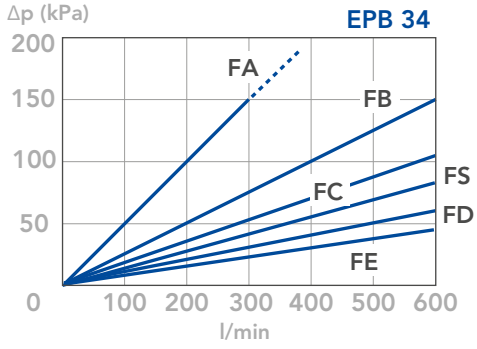


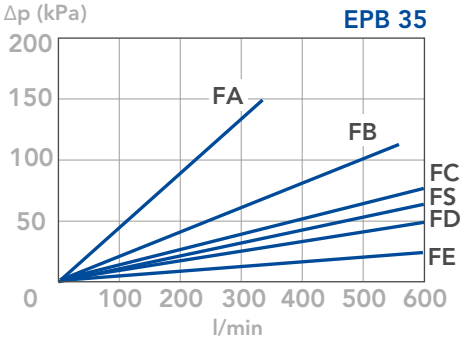












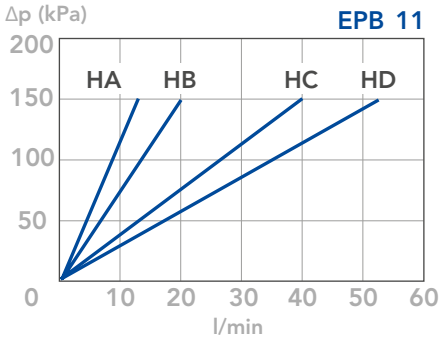
N.B.

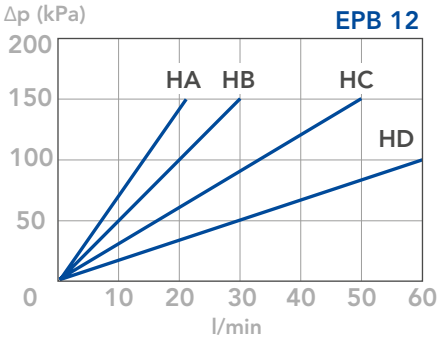
All the curves have been obtained with mineral oil having a kinematic viscosity 30 cSt and specific gravity 0,86 Kg/dm3; for fluids with different features, please consider the factors described in the first part of this catalogue. All the curves are obtained from test done at the UFI HYDRAULIC DIVISION Laboratory, according to the specification ISO 3968. In case of discrepancy, please check the contamination level, viscosity and features of the fluid in use.

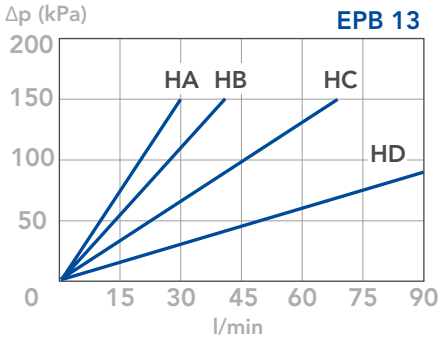
FPL-SPP
PRESSURE FILTERS

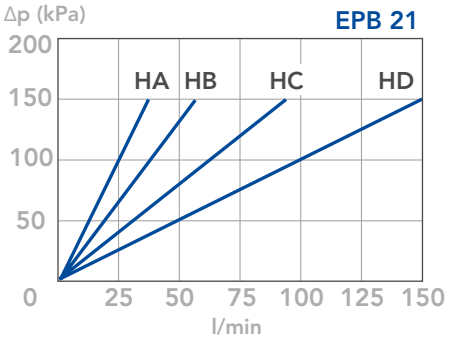
PRESSURE DROP CURVES (ΔP)

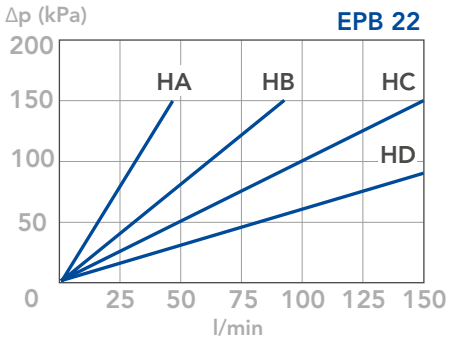
CLEAN FILTER ELEMENT PRESSURE DROP WITH H+ MEDIA
(depending both on the internal diameter of the element and on the filter media) - Recommended with no bypass option

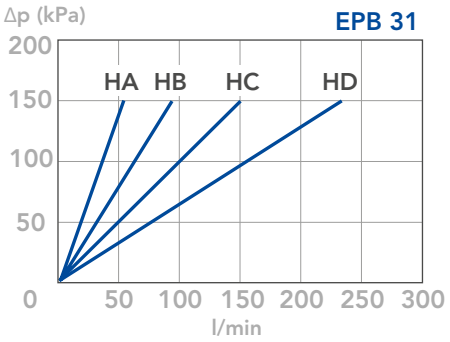


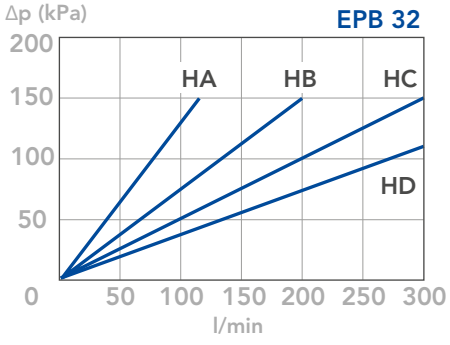


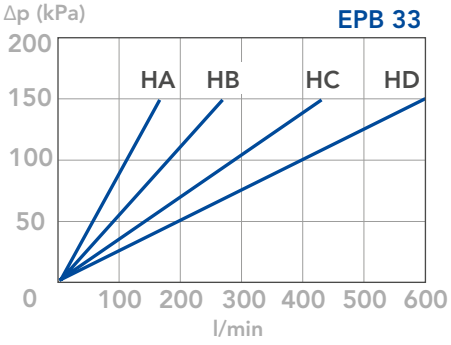


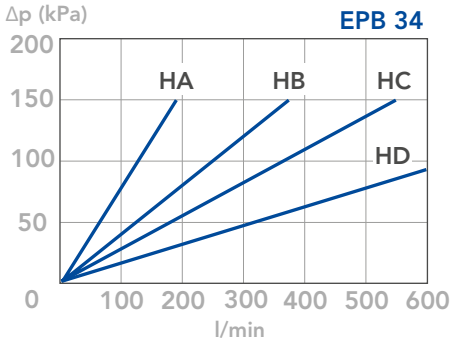


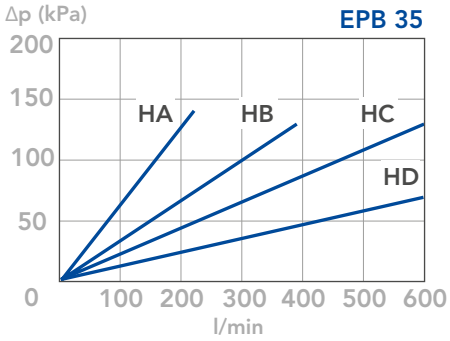






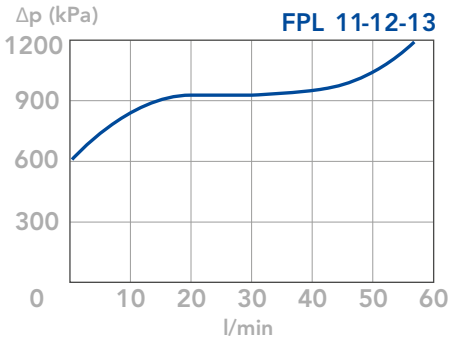


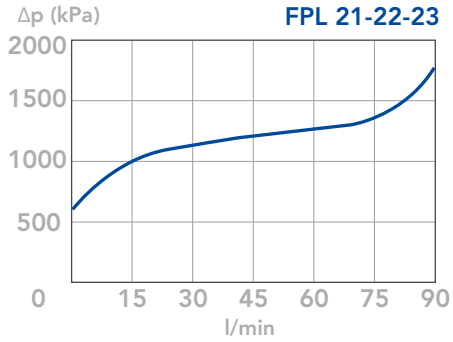


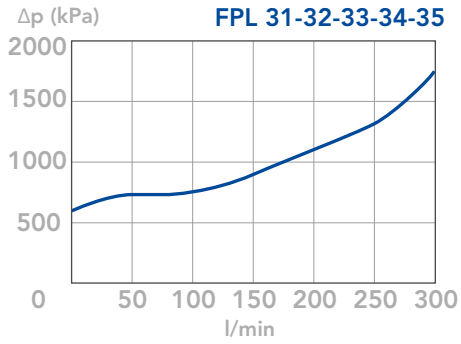


BYPASS VALVE PRESSURE DROP

When selecting the filter size, these curves must be taken into account if it is foreseen that any flow peak is to be absorbed by the bypass valve, it also must be of proper configuration to avoid pressure peaks. The valve pressure drop is directly proportional to fluid specific gravity.







N.B.

FPM-SPM
PRESSURE FILTERS

MATERIALS

Housing: Anodized aluminium alloy
Bypass valve: Steel
Seals: NBR Nitrile (FKM - on request fluoroelastomer)
Indicator housing: Brass

PRESSURE

Max working: 21 MPa (210 bar)
Collapse, differential for the filter element (ISO 2941):
2,1 MPa (21 bar)

BYPASS VALVE

Setting: 600 kPa (6 bar) ± 10%

WORKING TEMPERATURE

From -25° to +110° C

COMPATIBILITY (ISO 2943)

Full with fluids: HH-HL-HM-HV-HTG
(according to ISO 6743/4)
For fluids different than the above mentioned,
please contact our Customer Service.

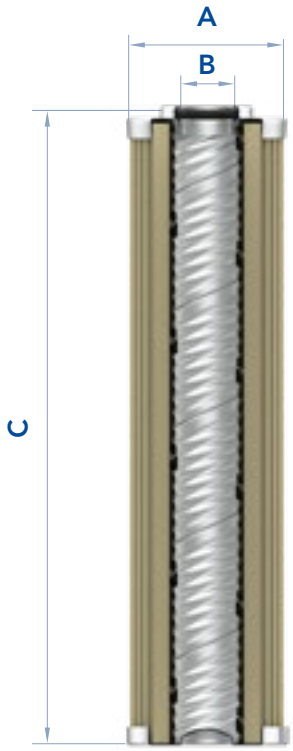
FPM21 SPM301	1/2" - 3/4" - 1"	205	111	100	1,5
FPM22 SPM302	1/2" - 3/4" - 1"	298	197	100	2,0

MAINTENANCE

The best time to change your filter element is just before it reaches its maximum dirt-holding capacity. For this reason, we recommend to monitor the pressure of the hydraulic oil flowing through the filter with a clogging indicator. When it is time to change the filter element, switch off the system before opening the filter housing and make sure there is no pressure in the filter. Unscrew the bowl and remove the dirty filter element. Replace it with an original UFI element, verifying the part number on the filter label or on the catalogue. Clean the bowl; check the gaskets conditions and replace if necessary. Insert the clean element into his seat, handling with care and cleanliness. Screw the housing until it stops, with a tightening torque of 60 Nm +5/0.
We recommend the stocking of a spare UFI filter element for timely replacement when required.



FILTER ELEMENT

	A	B	C	Kg	AREA (cm^2) Media F+
EPB21 CCH301	23,5	52	115	0,25	975
EPB22 CCH302	23,5	52	210	0,25	1.930

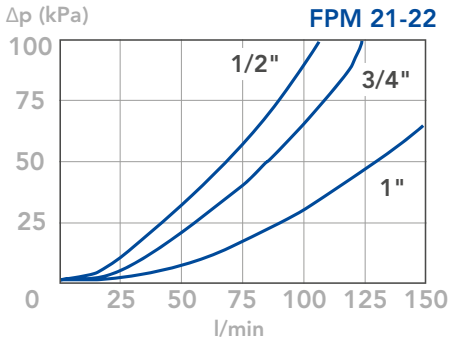
The used filter elements cannot be cleaned and are classified as “Dangerous waste material”. They must be disposed according to local laws by authorized Companies.
Verify that the Company you choose has the expertise and authorization to dispose this type of waste material.

FPM-SPM
PRESSURE FILTERS

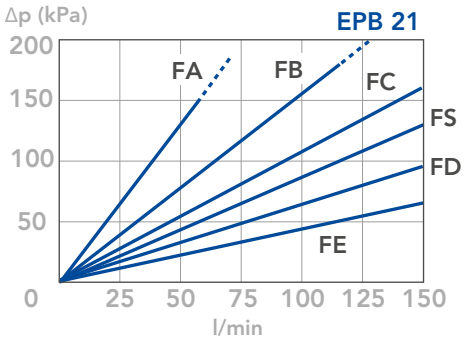
PRESSURE DROP CURVES (ΔP)

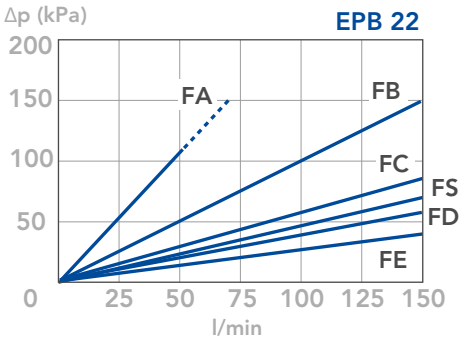
The “Assembly Pressure Drop (Δp)” is obtained by adding the pressure drop values of the Filter Housing and
of the Clean Filter Element corresponding to the considered Flow Rate and it must be lower than 120 kPa (1,2 bar) and should never exceed 1/3 of the bypass valve setting.

FILTER HOUSING PRESSURE DROP
(mainly depending on the port size)

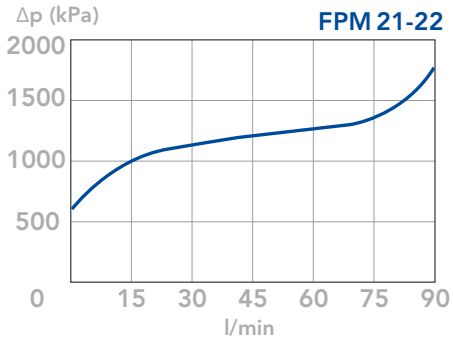


CLEAN FILTER ELEMENT PRESSURE DROP WITH F+ AND C+MEDIA
(depending both on the internal diameter of the element and on the filter media)





BYPASS VALVE PRESSURE DROP
When selecting the filter size, these curves must be taken into account if it is foreseen that any flow peak is to be absorbed by the bypass valve, it also must be of proper configuration to avoid pressure peaks. The valve pressure drop is directly proportional to fluid specific gravity.



N.B.

All the curves have been obtained with mineral oil having a kinematic viscosity 30 cSt and specific gravity 0,86 Kg/dm3; for fluids with different features, please consider the factors described in the first part of this catalogue. All the curves are obtained from test done at the UFI HYDRAULIC DIVISION Laboratory, according to the specification ISO 3968. In case of discrepancy, please check the contamination level, viscosity and features of the fluid in use.

RETURN FILTERS

RETURN-LINE SAFEGUARDS FLUID CLEANLINESS

Application:
Hydraulic Return-Filters are used on the return-side of the hydraulic-circuit, where the oil re-enters the tank-reservoir.
This type of filter should be sized for the maximum flow of the hydraulic system.
To avoid "foaming" in the reservoir, the return flow-pipe must be located below the liquid level in the tank.
As a general "rule of thumb," the distance between the bottom of the reservoir-tank and the end of the return-pipe should be more than 2 to 3 times larger than the pipe diameter.

User Benefits:
Space-saving "tank-top" mounting avoids excessive piping.
Externally-mounted filters, keep contamination outside of the tank-reservoir and are often more accessible for filter element replacement.
Main benefits:

- Light-weight / compact-design. Tank-reservoir filling via the filter top-cap
- helps maintain system cleanliness
- Ease of maintenance and filter element replacement
- Filters available with built-in air breathers
- Integral filter element by-pass valves

FRA-RFM
RETURN FILTERS

MATERIALS

Head and cover : Aluminium alloy
Bowl :
Polyammide for FRA21-31-32-33-41
Zinc plated steel for FRA11-42-51-52- 53-5D
Bypass valve: Polyammide
Seals: NBR Nitrile
FKM Fluoroelastomer on request
Indicator housing: Brass

PRESSURE

Max. working: 300 kPa (3 bar)
Collapse, differential for the filter element (ISO 2941): 300 kPa (3 bar)

BYPASS VALVE

Setting: 170 kPa (1,7 bar) ± 10%

WORKING TEMPERATURE

From -25° to +110° C

COMPATIBILITY (ISO 2943)

Full with fluids: HH-HL-HM-HV-HTG
(according to ISO 6743/4)
For fluids different than the above mentioned,
please contact our Customer Service.

MAINTENANCE

The best time to change your filter element is just before it reaches its maximum dirt-holding capacity. For this reason, we recommend to monitor the pressure of the hydraulic oil flowing through the filter with a clogging indicator. When it is time to change the filter element, switch off the system before opening the filter housing. Unscrew the cover of the filter head and remove the spring (to be hold) and the dirty filter element. Replace it with an original UFI element, verifying the part number on the filter label or on the catalogue. Clean the bowl; check the gaskets conditions and replace if necessary. Insert the clean element and the spring into his seat, handling with care and cleanliness. Replace the cover on the filter head with the screw.
We recommend the stocking of a spare UFI filter element for timely replacement when required.

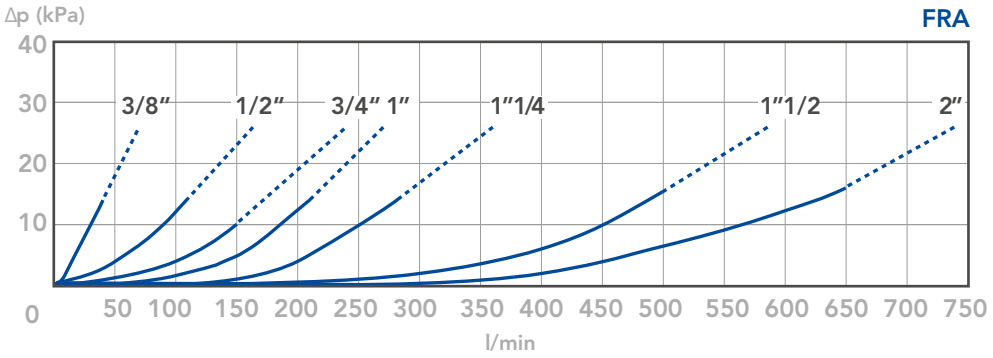
The used filter elements cannot be cleaned and are classified as “Dangerous waste material”. They must be disposed according to local laws by authorized Companies.
Verify that the Company you choose has the expertise and authorization to dispose this type of waste material.

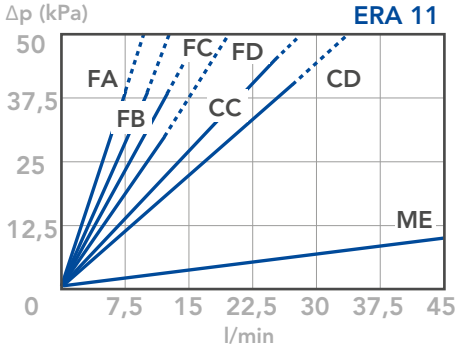
PRESSURE DROP CURVES (ΔP)

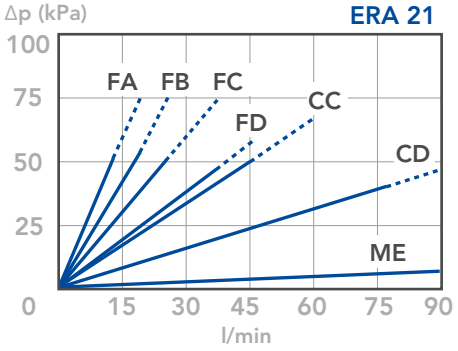
The “Assembly Pressure Drop (Δp)” is obtained by adding the pressure drop values of the Filter Housing and of the Clean Filter Element corresponding to the considered Flow Rate and it must be lower than 50 kPa (0,5 bar) and should never exceed 1/3 of the bypass valve setting.

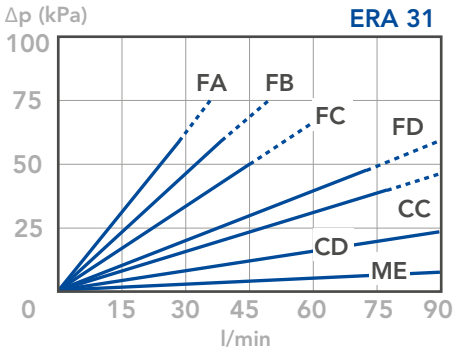
FILTER HOUSING PRESSURE DROP
(mainly depending on the port size)

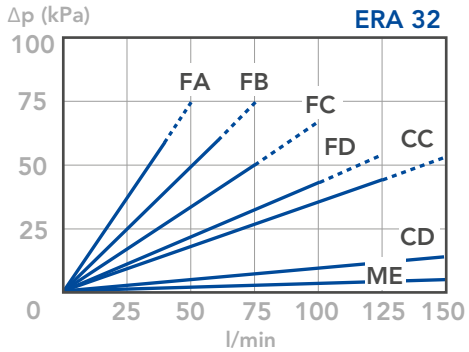


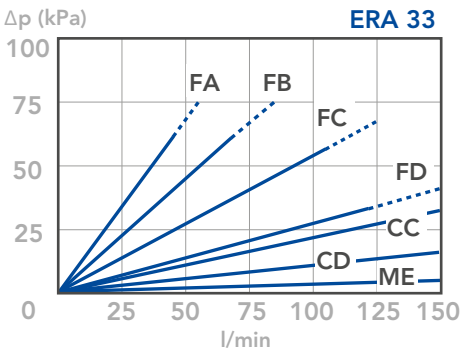
CLEAN FILTER ELEMENT PRESSURE DROP
(pressure drop values of the elements by ME - MF - MG media are very similar)











FRA-RFM
RETURN FILTERS

BYPASS VALVE PRESSURE DROP

When selecting the filter size, these curves must be taken into account if it is foreseen that any flow peak is to be absorbed by the bypass valve, it also must be of proper configuration to avoid pressure peaks. The valve pressure drop is directly proportional to fluid specific gravity.

MAINTENANCE

The best time to change your filter element is just before it reaches its maximum dirt-holding capacity. For this reason, we recommend to monitor the pressure of the hydraulic oil flowing through the filter with a clogging indicator. When it is time to change the filter element, switch off the system before opening the filter housing. Unscrew the cover of the filter head and remove the spring (to be hold) and the dirty filter element. Replace it with an original UFI element, verifying the part number on the filter label or on the catalogue. Clean the bowl; check the gaskets conditions and replace if necessary. Insert the clean element and the spring into his seat, handling with care and cleanliness. Replace the cover on the filter head with the screw.
We recommend the stocking of a spare UFI filter element for timely replacement when required.

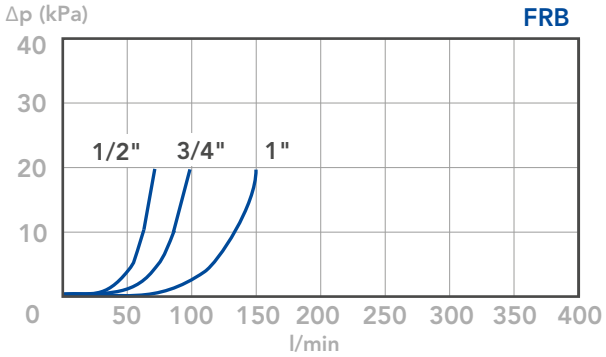
The used filter elements cannot be cleaned and are classified as “Dangerous waste material”. They must be disposed according to local laws by authorized Companies.
Verify that the Company you choose has the expertise and authorization to dispose this type of waste material.

FRB-RFA
RETURN FILTERS

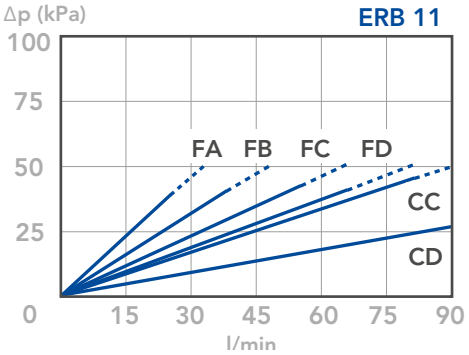
PRESSURE DROP CURVES (ΔP)

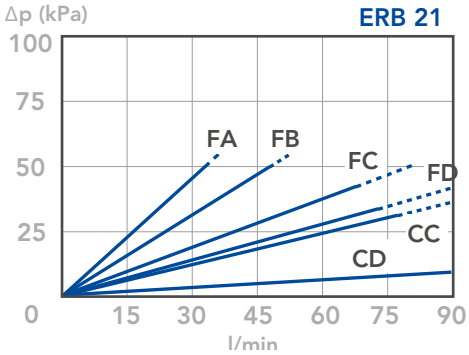
The “Assembly Pressure Drop (Δp)” is obtained by adding the pressure drop values of the Filter Housing and of the Clean Filter Element corresponding to the considered Flow Rate and it must be lower than 50 kPa (0,5 bar) and should never exceed 1/3 of the bypass valve setting.

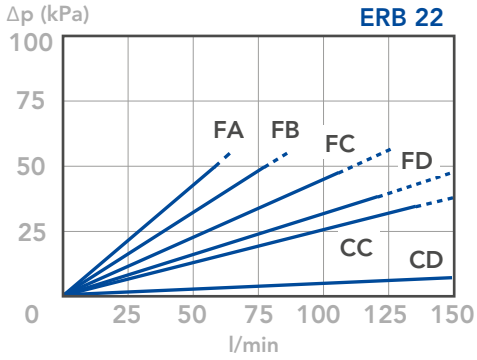
FILTER HOUSING PRESSURE DROP
(mainly depending on the port size)

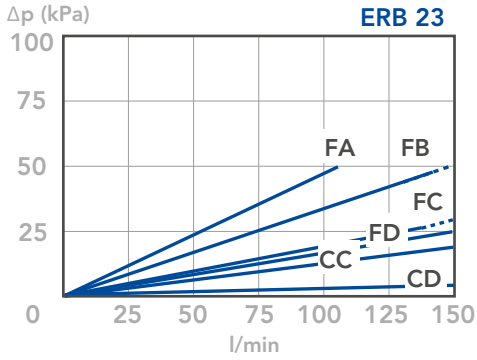


CLEAN FILTER ELEMENT PRESSURE DROP WITH F+ AND C+ MEDIA
(depending both on the internal diameter of the element and on the filter media)

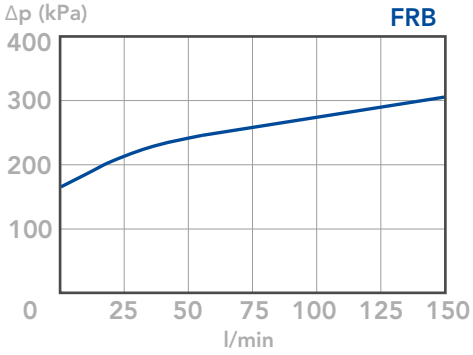








BYPASS VALVE PRESSURE DROP
When selecting the filter size, these curves must be taken into account if it is foreseen that any flow peak is to be absorbed by the bypass valve, it also must be of proper configuration to avoid pressure peaks. The valve pressure drop is directly proportional to fluid specific gravity.



N.B.

All the curves have been obtained with mineral oil having a kinematic viscosity 30 cSt and specific gravity 0,86 Kg/dm3; for fluids with different features, please consider the factors described in the first part of this catalogue. All the curves are obtained from test done at the UFI HYDRAULIC DIVISION Laboratory, according to the specification ISO 3968. In case of discrepancy, please check the contamination level, viscosity and features of the fluid in use.

RETURN FILTERS

MATERIALS

Head : Aluminium alloy
Spin-on cartridge: Steel
Bypass valve: Polyammide
Seals: NBR Nitrile
Indicator housing: Brass

PRESSURE

Max. working: 700 kPa (7 bar)
Collapse, differential for the filter element (ISO 2941):
300 kPa (3 bar)

BYPASS VALVE

Setting: 170 kPa (1,7 bar) ± 10%

WORKING TEMPERATURE

From -25° to +110° C

COMPATIBILITY (ISO 2943)

Full with fluids: HH-HL-HM-HV-HTG
(according to ISO 6743/4)
For fluids different than the above mentioned,
please contact our Customer Service.

MAINTENANCE

The best time to change your filter element is just before it reaches its maximum dirt-holding capacity. For this reason, we recommend to monitor the pressure of the hydraulic oil flowing through the filter with a clogging indicator. When it is time to change the filter element, switch off the system.
Unscrew the cover and remove it. If the filter has a by-pass valve, don't touch it.

Remove the dirty filter element using the upper handle. Replace it with an original UFI element, verifying the part number on the filter label or on the catalogue. Lubricate the gaskets for an optimal assembly. Position the cover carefully to ensure the seal on the filter element. Tighten the screws with the washers until it stops.
We recommend the stocking of a spare UFI filter element for timely replacement when required.

FILTER ELEMENT

					AREA (cm²)		
	A	B	C	Kg	Media F+	Media C+	Media M+

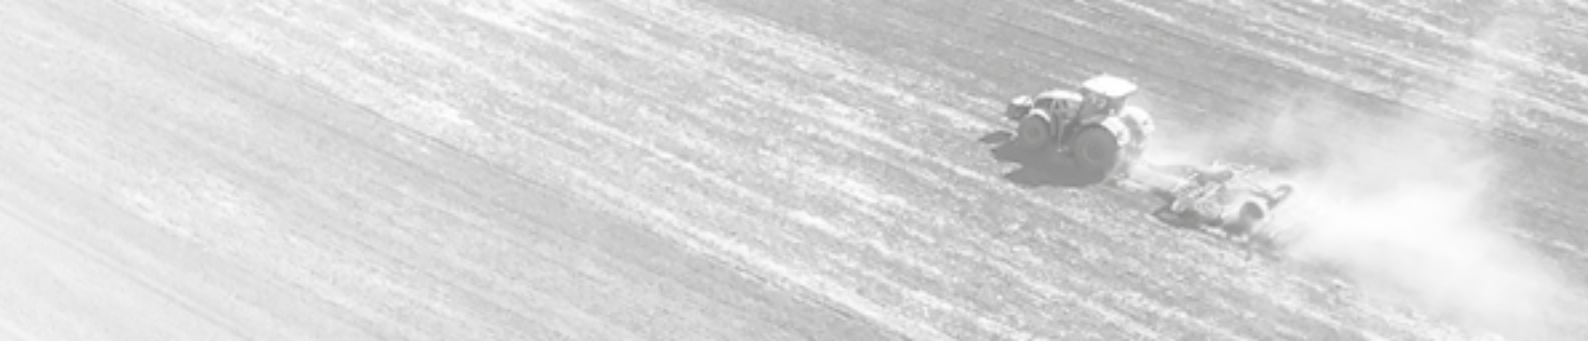
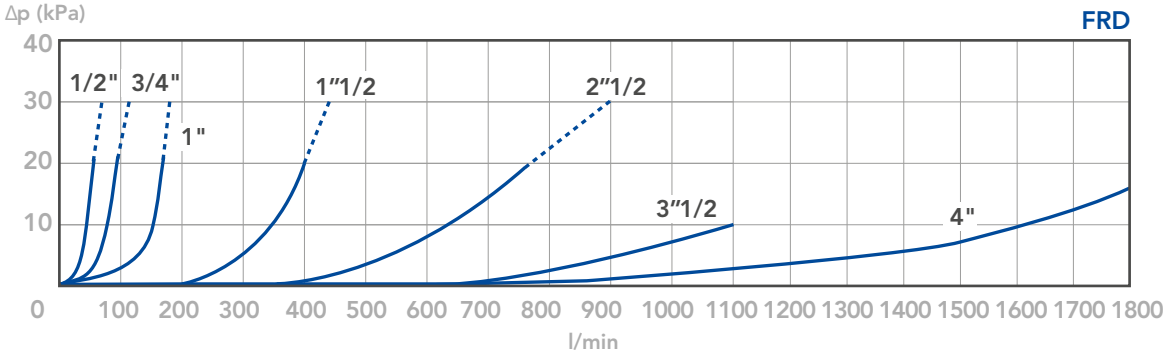
The used filter elements cannot be cleaned and are classified as "Dangerous waste material". They must be disposed according to local laws by authorized Companies.
Verify that the Company you choose has the expertise and authorization to dispose this type of waste material.



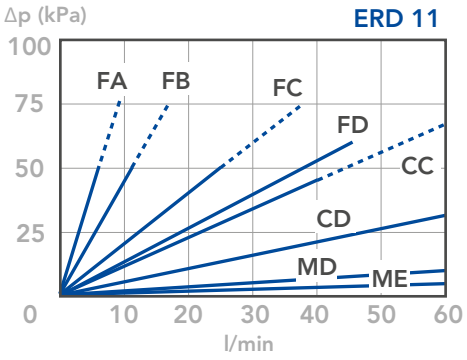
PRESSURE DROP CURVES (ΔP)

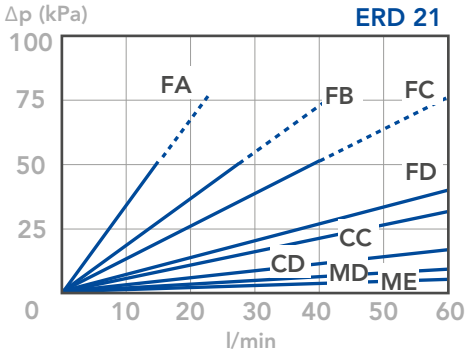
The “Assembly Pressure Drop (Δp)” is obtained by adding the pressure drop values of the Filter Housing and
of the Clean Filter Element corresponding to the considered Flow Rate and it must be lower than 50 kPa (0,5 bar) and should never exceed 1/3 of the bypass valve setting.

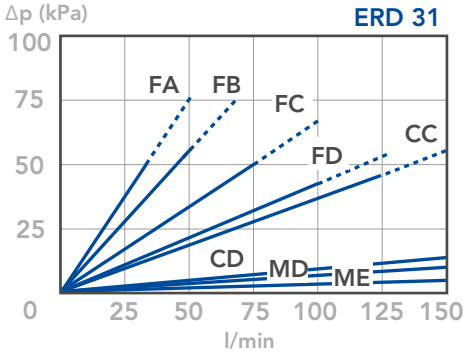
FILTER HOUSING PRESSURE DROP
(mainly depending on the port size)



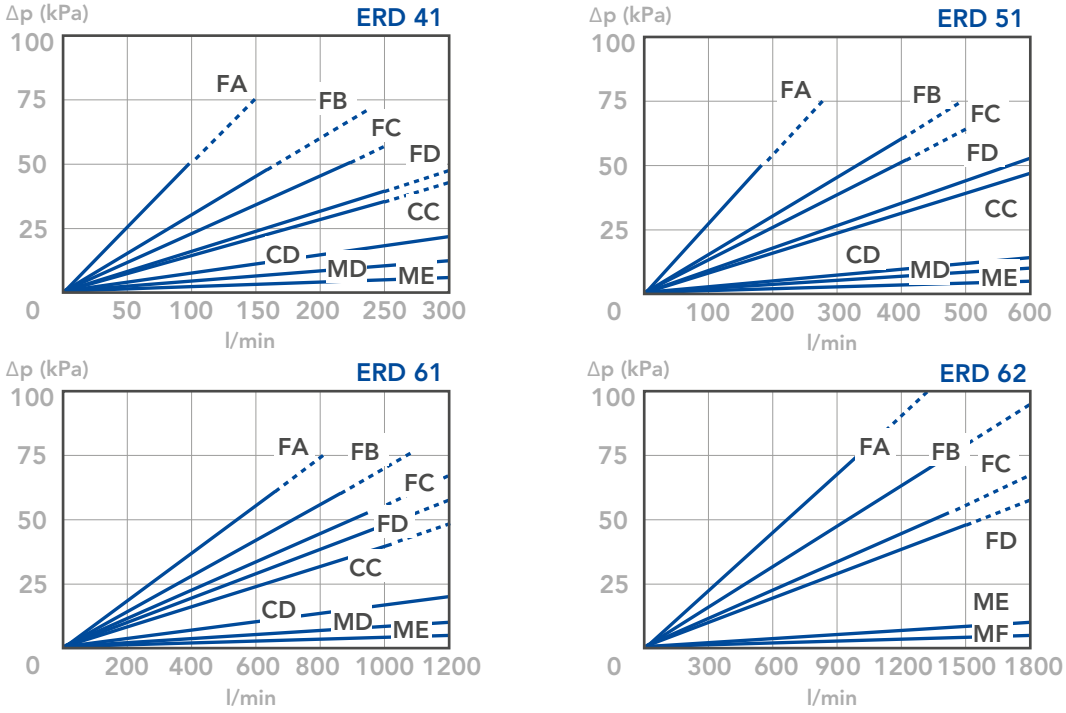
CLEAN FILTER ELEMENT PRESSURE DROP WITH F+, C+ AND M+ MEDIA
(depending both on the internal diameter of the element and on the filter media)





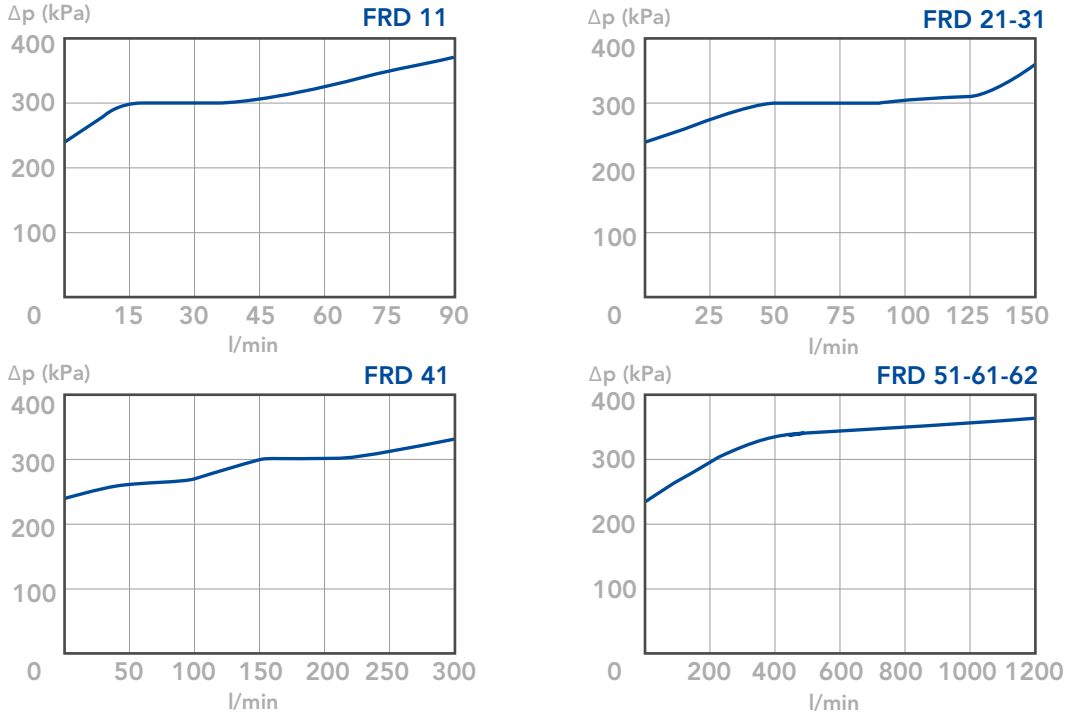


FRD-MRH
RETURN FILTERS



BYPASS VALVE PRESSURE DROP

When selecting the filter size, these curves must be taken into account if it is foreseen that any flow peak is to be absorbed by the bypass valve, it also must be of proper configuration to avoid pressure peaks. The valve pressure drop is directly proportional to fluid specific gravity.



N.B.

All the curves have been obtained with mineral oil having a kinematic viscosity 30 cSt and specific gravity 0,86 Kg/dm3; for fluids with different features, please consider the factors described in the first part of this catalogue. All the curves are obtained from test done at the UFI HYDRAULIC DIVISION Laboratory, according to the specification ISO 3968. In case of discrepancy, please check the contamination level, viscosity and features of the fluid in use.

FRF-RFC
RETURN FILTERS

MATERIALS

Head and cover: Aluminium alloy
Diffusor: Zinc plated steel
Element support:
Polyammide (aluminium alloy for FRF3+ and FRF4+)
Magnetic core: Syntherized magnetic material
Seals: NBR Nitrile
(FKM Fluoroelastomer on request)
Indicator housing: Brass

PRESSURE

Max. working: 1 MPa (10 bar)
Collapse, differential for the filter element (ISO 2941): 1 MPa (10 bar)

BYPASS VALVE

Setting: 170 kPa (1,7 bar) ± 10%

WORKING TEMPERATURE

From -25° to +110° C

COMPATIBILITY (ISO 2943)

Full with fluids: HH-HL-HM-HV-HTG
(according to ISO 6743/4)
For fluids different than the above mentioned,
please contact our Customer Service.

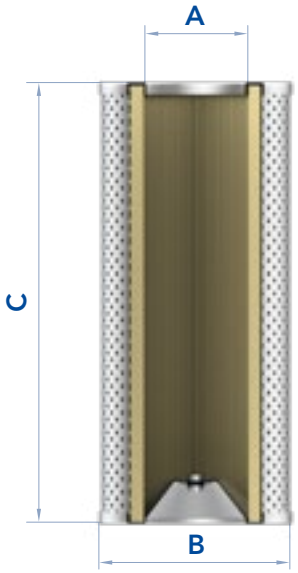
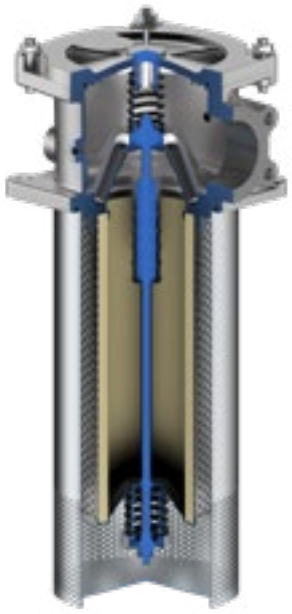
MAINTENANCE

The best time to change your filter element is just before it reaches its maximum dirt-holding capacity. For this reason, we recommend to monitor the pressure of the hydraulic oil flowing through the filter with a clogging indicator. When it is time to change the filter element, switch off the system.
Loosen the nuts of the cover, turn clockwise and remove it. Extract the dirty filter element using theupper handle, if necessary remove the spring.

Unscrew the nut at the bottom of the element from the tie rod. Remove the spring holder and the spring. Replace it with an original UFI element, verifying the part number on the filter label or on the catalogue. Assembly in sequence the spring, the spring holder and screw the nut on the tie rod until it stops. Position the cover and tighten the nuts until it stops.
We recommend the stocking of a spare UFI filter element for timely replacement when required.





The used filter elements cannot be cleaned and are classified as “Dangerous waste material”. They must be disposed according to local laws by authorized Companies.
Verify that the Company you choose has the expertise and authorization to dispose this type of waste material.

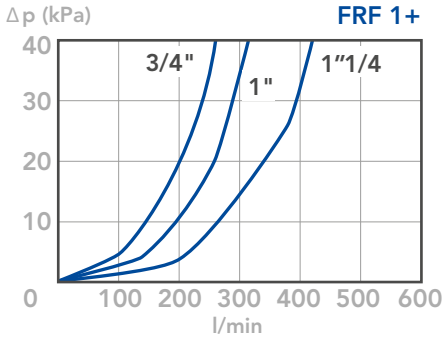
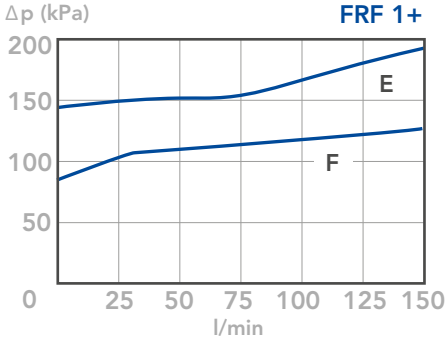
PRESSURE DROP CURVES (ΔP) 1+ DIAGRAMS

The “Assembly Pressure Drop (Δp)” is obtained by adding the pressure drop values of the Filter Housing and
of the Clean Filter Element corresponding to the considered Flow Rate and it must be lower than 50 kPa (0,5 bar) and should never exceed 1/3 of the bypass valve setting.

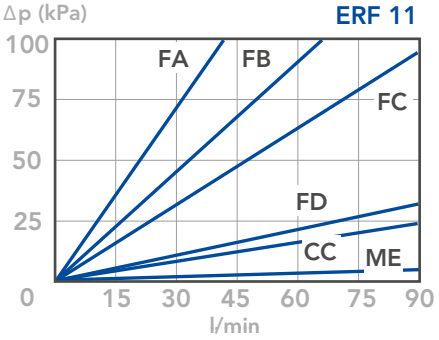
FILTER HOUSING PRESSURE DROP
(mainly depending on the port size)

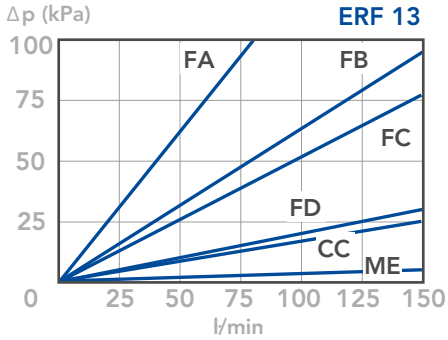
BYPASS VALVE PRESSURE DROP
When selecting the filter size, these curves must be taken into account if it is foreseen that any flow peak is to be absorbed by the bypass valve, it also must be of proper configuration to avoid pressure peaks. The valve pressure drop is directly proportional to fluid specific gravity.

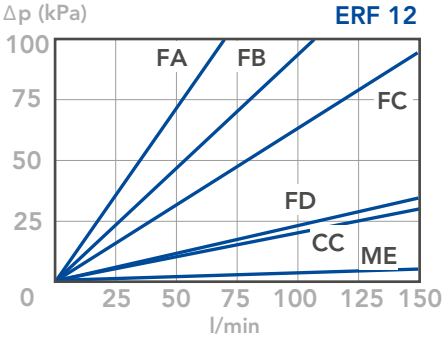


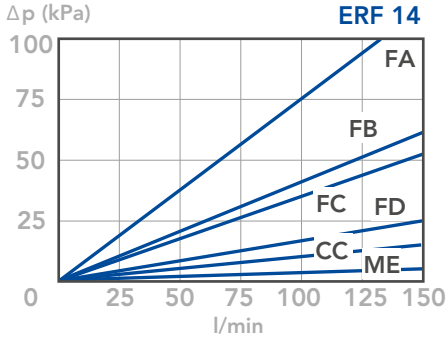


CLEAN FILTER ELEMENT PRESSURE DROP WITH F+, C AND ME MEDIA
(depending both on the internal diameter of the element and on the filter media)









N.B.

All the curves have been obtained with mineral oil having a kinematic viscosity 30 cSt and specific gravity 0,86 Kg/dm3; for fluids with different features, please consider the factors described in the first part of this catalogue. All the curves are obtained from test done at the UFI HYDRAULIC DIVISION Laboratory, according to the specification ISO 3968. In case of discrepancy, please check the contamination level, viscosity and features of the fluid in use.

MATERIALS

Diffusor: Zinc plated steel
Element support: Polyammide
(aluminium alloy for FRG3+ & FRG4+)
Magnetic core: Syntherized magnetic material
Seals: NBR Nitrile
(FKM Fluoroelastomer on request)

PRESSURE

Collapse, differential for the filter element (ISO 2941): 1 MPa (10 bar)

BYPASS VALVE

Setting: 170 kPa (1,7 bar) ± 10%

WORKING TEMPERATURE

From -25° to +110° C

COMPATIBILITY (ISO 2943)

Full with fluids: HH-HL-HM-HV-HTG
(according to ISO 6743/4)
For fluids different than the above mentioned,
please contact our Customer Service.

MAINTENANCE

The best time to change your filter element is just before it reaches its maximum dirt-holding capacity. For this reason, we recommend to monitor the pressure of the hydraulic oil flowing through the filter with a clogging indicator. When it is time to change the filter element, switch off the system. Remove the complete filter by upper handle and if necessary remove the spring. Unscrew the nut from tie-rod and remove the spring holder and the spring. Remove dirty filter element. If the magnetic core is present on the tie rod, clean it carefully. Replace it with an original UFI element, verifying the part number on the filter label or on the catalogue. Lubricate the new element O-Ring gasket with oil. Insert the clean element on tie-rod handling with care and cleanliness. Assembly the spring, spring holder and tighten the nut on the tie-rod until it stops, with a tightening torque of 15 Nm +3/0. Insert the complete filter into the seat.

We recommend the stocking of a spare UFI filter element for timely replacement when required.

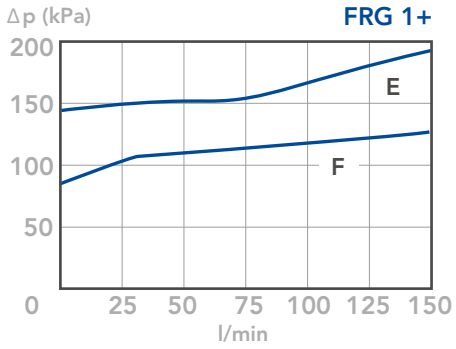
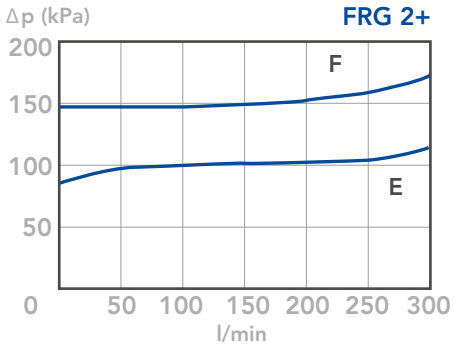
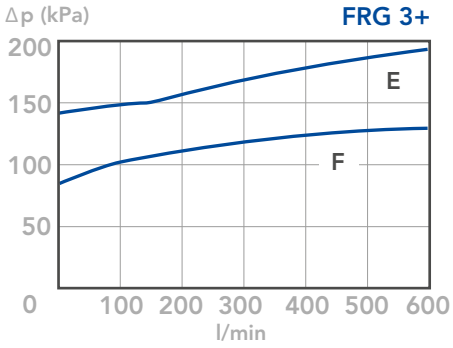
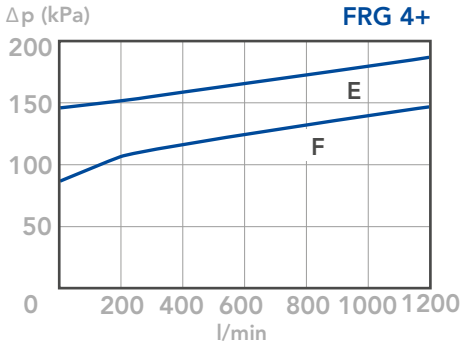
BYPASS VALVE PRESSURE DROP

When selecting the filter size, these curves must be taken into account if it is foreseen that any flow peak is to be absorbed by the bypass valve, it also must be of proper configuration to avoid pressure peaks. The valve pressure drop is directly proportional to fluid specific gravity.









N.B.

All the curves have been obtained with mineral oil having a kinematic viscosity 30 cSt and specific gravity 0,86 Kg/dm3; for fluids with different features, please consider the factors described in the first part of this catalogue. All the curves are obtained from test done at the UFI HYDRAULIC DIVISION Laboratory, according to the specification ISO 3968. In case of discrepancy, please check the contamination level, viscosity and features of the fluid in use.

MAINTENANCE

The best time to change your filter element is just before it reaches its maximum dirt-holding capacity. For this reason, we recommend to monitor the pressure of the hydraulic oil flowing through the filter with a clogging indicator. When it is time to change the filter element, switch off the system before opening the filter housing. Unscrew the cover of the filter head and remove the spring (to be hold) and the dirty filter element. Replace it with an original UFI element, verifying the part number on the filter label or on the catalogue. Clean the bowl; check the gaskets conditions and replace if necessary. Insert the clean element and the spring into his seat, handling with care and cleanliness. Replace the cover on the filter head with the screw.
We recommend the stocking of a spare UFI filter element for timely replacement when required.

FILTER ELEMENT

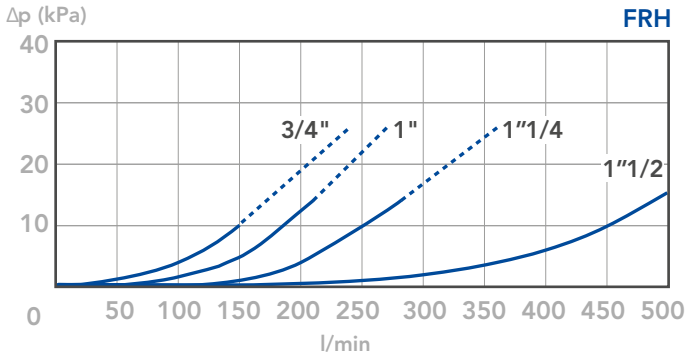
					AREA (cm^2)	
	A	B	C	Kg	Media F+	Media C+
ERA31	70	28	85	0,20	620	990
ERA32	70	28	130	0,25	1.000	1.600
ERA33	70	40	210	0,40	1.660	2.670
ERA41	99	40	211	0,75	3.800	4.280
ERA42	99	40	250	0,90	4.550	5.100

The used filter elements cannot be cleaned and are classified as “Dangerous waste material”. They must be disposed according to local laws by authorized Companies.
Verify that the Company you choose has the expertise and authorization to dispose this type of waste material.

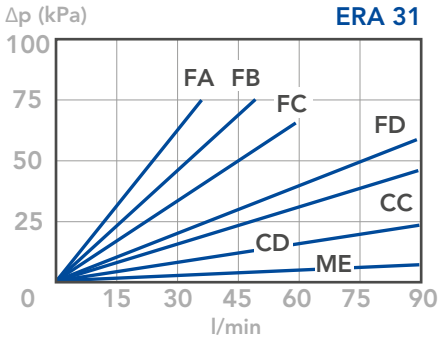
PRESSURE DROP CURVES (ΔP)

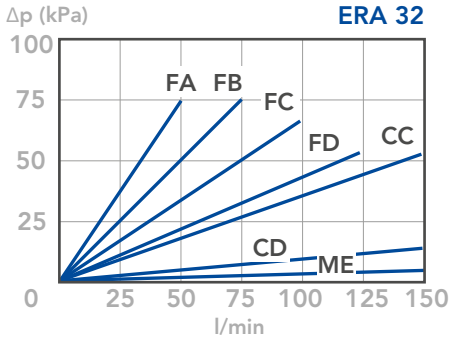
The “Assembly Pressure Drop (Δp)” is obtained by adding the pressure drop values of the Filter Housing and
of the Clean Filter Element corresponding to the considered Flow Rate and it must be lower than 50 kPa (0,5 bar) and should never exceed 1/3 of the bypass valve setting

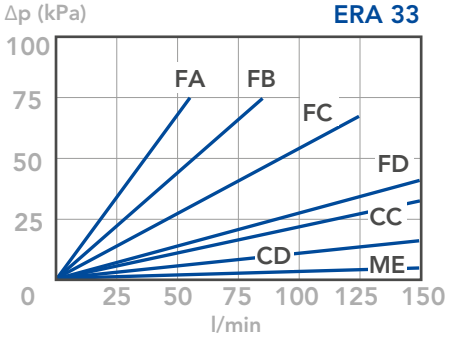
FILTER HOUSING PRESSURE DROP
(mainly depending on the port size)

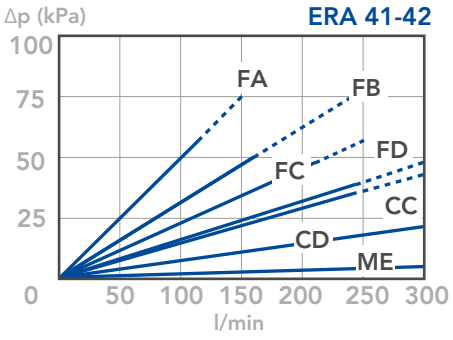


CLEAN FILTER ELEMENT PRESSURE DROP WITH F+, C+ AND ME MEDIA
(depending both on the internal diameter of the element and on the filter media)









FRH

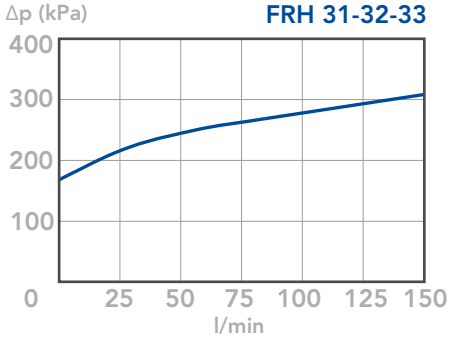
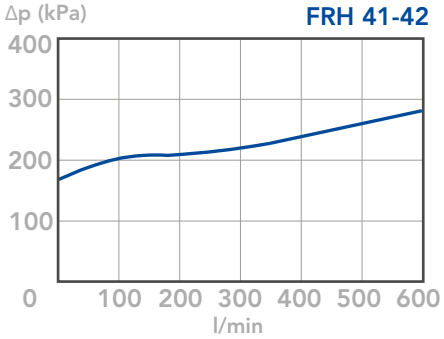
BYPASS VALVE PRESSURE DROP

When selecting the filter size, these curves must be taken into account if it is foreseen that any flow peak is to be absorbed by the bypass valve, it also must be of proper configuration to avoid pressure peaks. The valve pressure drop is directly proportional to fluid specific gravity.





N.B.

All the curves have been obtained with mineral oil having a kinematic viscosity 30 cSt and specific gravity 0,86 Kg/dm3; for fluids with different features, please consider the factors described in the first part of this catalogue. All the curves are obtained from test done at the UFI HYDRAULIC DIVISION Laboratory, according to the specification ISO 3968. In case of discrepancy, please check the contamination level, viscosity and features of the fluid in use.

OFF-LINE FILTERS

FLUSHING AND HYDRAULIC-FLUID TRANSFER

Application:
Off-line filters are used to maintain "Roll-Off-Cleanliness" in the hydraulic-fluid circuit at the time a new vehicle leaves the manufacturing assembly-line or a vehicle undergoes repair or re-build. Stationary off-line filters work at system-pressure and can be connected to the hydraulic-circuit of the vehicle in such a way that it becomes the "power-supply." The circuit can be cycled to flush out and remove harmful contamination to pre-condition the oil for longevity and improved service-life. Off-line filters maintain "Roll-Off"-Cleanliness. Where the level of cleanliness is insufficient to remove harmful contamination from "Built-in," "Brought-in", "Induced-in" and "Taken-in" sources, the result can be premature vehicle breakdown/failure within the warranty period.

User Benefits:
- "Built-in" – contamination left in the system or in componentry during initial vehicle assembly or vehicle repair/re-build.
- "Brought-in" - components and/or sub-assemblies "brought-in" or manufactured off-line/off-site, may be contaminated and add to the overall levels of contamination on the vehicle during assembly, repair or re-build.
- "Induced-in" - contamination internally "induced" into the system during operation and performance-testing or caused by wear, corrosion, agitation, oxidation or hydraulic-fluid degradation.
- "Taken-in" - Externally introduced contamination that enters a system from the atmosphere via insufficiently sealed orifices, covers or access-points.

UOW-GTC
OFF-LINE FILTERS

PORTABLE FILTRATION PACKAGE

Inlet: flexible hose, 2 m long with rigid end 0,5 m long
Outlet: flexible hose, 2 m long with rigid end 0,5 m long
“Y” type filter for pump protection
Gear pump 40 l/min with inbuilt 1 MPa (10 bar) relief valve
Electric motor: three phase 380V - 0,75 kW 1450 rpm - IP54
Double handle for proper and easy transportation

MODEL UOW040T0075A3

Oil transfer and filtration package of clean and compact construction, joining high filtration performances and long life filter element to an easy and handy use.

The filter can be fitted with a visual or electrical clogging indicator, also of differential type.

The filter element, having a wide filtration area (12.800 cm2) and excellent efficiency features, is normally available with filtration degree 5, 7, 12 and 21µm(c) (ßx > 1.000) and WR (Hydro Dry).
Total weight 50 kg.

Filter element, to be ordered apart.
(please refer to the FOF series datasheet for the technical features).

N.B.

The UOW mobile off-line filtration unit filters hydraulic fluid at low-pressure with the aid of a self-contained pump, motor and filter.
Oil returning to the tank-reservoir from the return line is filtered by the UOW unit, which drastically reduces "clean-up time."
The mobile filtration unit includes a detailed use and maintenance instruction manual.

HYDRO DRY
OFF-LINE FILTERS

WATER REMOVAL ELEMENTS

The hydro-dry filter elements remove up to 80% of the free water present in the oil.

The hydro-dry elements use the WR filter media, working by absorption and ensuring a high water retention capacity.

To get the maximum water removal efficiency the hydro-dry elements must be used at constant flow rate and low and constant pressure, i.e. the ideal use is in a off-line filter or in a filtration trolley.

The hydro-dry elements remove also the solid contamination (ß21(c) > 1.000), but we recommend that the main part of solid contamination is removed upstream by a dedicated return filter.

The hydro-dry elements are available in standard dimensions, to fit standard filter housings.

A clogging indicator set at 130 kPa (1,3 bar) on the filter housing is recommended for proper replacement of the clogged element.

Is this datasheet the latest release? Please check on our website.

TRANSMISSION FILTERS

COMBINED RETURN & SUCTION FILTER

Application:
Hydraulic transmissions are usually configurated in one of two ways, split or closed-coupled. A split transmission consists of a power unit with hydraulic pump, heat-exchanger, hydraulic filter(s), valves and controls mounted on a tank-reservoir. Split transmissions are typically used in heavy-duty applications. Split transmissions offer a wide range of flexibility in terms of system-configuration for the most efficient use of space and weight distribution. Combined Return & Suction Filters replace the need for suction- or pressure filters for the charge-pump in closed-loop hydrostatic-drive circuits and for return filters in the open-loop hydraulic circuit (Split transmissions).

User Benefits:
- Lightweight construction. Space-saving
- Less piping required / fewer potential leakage points
- Requirement for only one filter instead of two
  1. Filtration of the oil returning from the hydraulic system
  2. Feeding the charge-pump with clean filtered oil
- The charge-pump takes oil at a slight pressure (0.5 bar), avoiding cavitation risks but also contributing to good cold-start behavior
- Charge-pump protection as the oil supplied is already pre-filtered
- Simplified maintenance & Easy filter element removal, with retained contamination

FTA-FTB-KTS
TRANSMISSION FILTERS

MATERIALS

Head: Aluminium alloy
Cover: Polyammide FTA-FTB23
Aluminium alloy FTA-FTB31-32-33
Bowl: Steel
Seals: NBR Nitrile
Indicator housing: Brass

PRESSURE

Max working: 1 MPa (10 bar)
Collapse, differential for the filter element (ISO 2941):
1 MPa (10 bar)

BYPASS VALVE

Setting: 250 kPa (2,5 bar) ± 10%

WORKING TEMPERATURE

From -25° to + 110° C

COMPATIBILITY (ISO 2943)

Full with fluids: HH-HL-HM-HV-HTG
(according to ISO 6743/4)
For fluids different than the above mentioned,
please contact our Customer Service

TRANSMISSION FILTERS

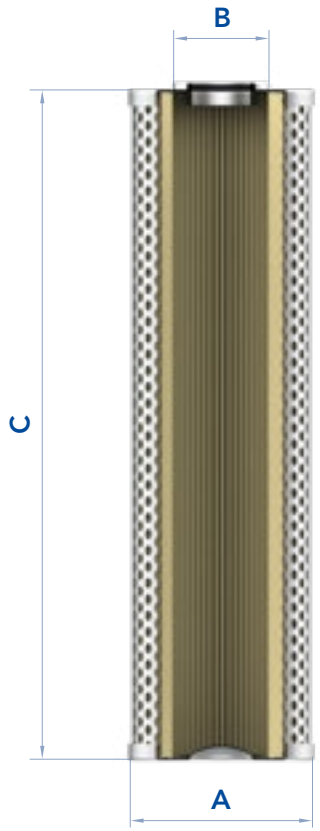
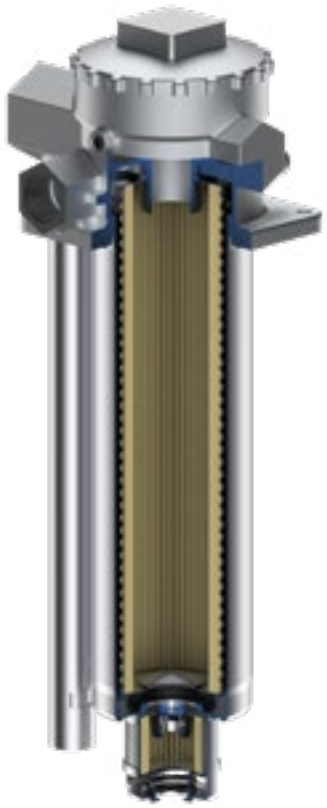
MAINTENANCE

The best time to change your filter element is just before it reaches its maximum dirt-holding capacity. For this reason, we recommend to monitor the pressure of the hydraulic oil flowing through the filter with a clogging indicator. When it is time to change the filter element, switch off the system before opening the filter housing.
Unscrew the plug and extract the handle from the housing. Remove the dirty filter element and replace it with an original UFI element, verifying the part number on the filter label or on the catalogue. Clean the handle, check the handle O-Ring condition and lubricate with oil.
Check the gaskets conditions and replace if necessary. Insert the clean element on the shank of the handle, handling with care and cleanliness. Replace the handle complete with filter element in the housing ensuring the sealing of the gasket. Tighten the plug until it stops with the following tightening torques:
KTS 105-110 Series: 25 Nm +5/0
KTS 210-220-230 Series: 35 Nm +5/0
We recommend the stocking of a spare UFI filter element for timely replacement when required.





FILTER ELEMENT

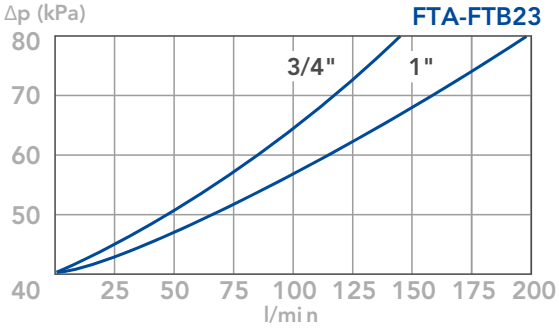
					AREA (cm²)
	A	B	C	KG	Media F+
ETA23 CKT110	63,5	28	230	0,40	1.900
ETA31 CKT210	90	40	232	0,55	2.800
ETA32 CKT220	90	40	333	0,77	4.100
ETA33 CKT230	90	40	400	0,85	4.900

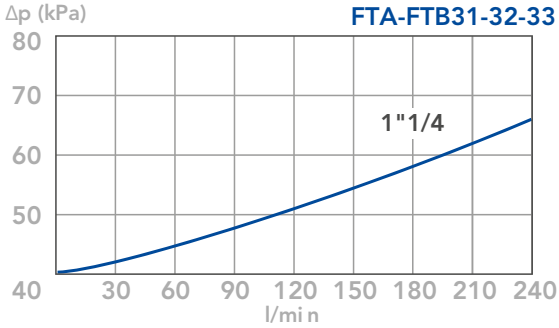
The used filter elements cannot be cleaned and are classified as “Dangerous waste material”. They must be disposed according to local laws by authorized Companies.
Verify that the Company you choose has the expertise and authorization to dispose this type of waste material.

PRESSURE DROP CURVES (ΔP)

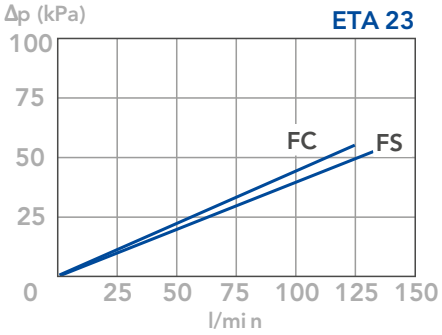
The “Assembly Pressure Drop (Δp)” is obtained by adding the pressure drop values of the Filter Housing and of the Clean Filter Element corresponding to the considered Flow Rate and it must be lower than 40 kPa (0,4 bar) and should never exceed 1/3 of the bypass valve setting.

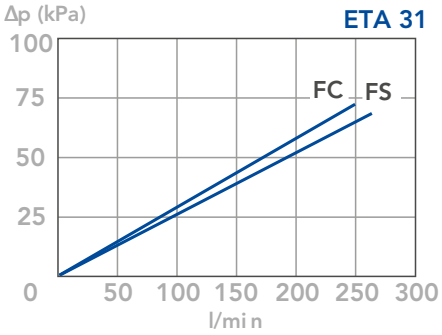
FILTER HOUSING PRESSURE DROP
(mainly depending on the port size)

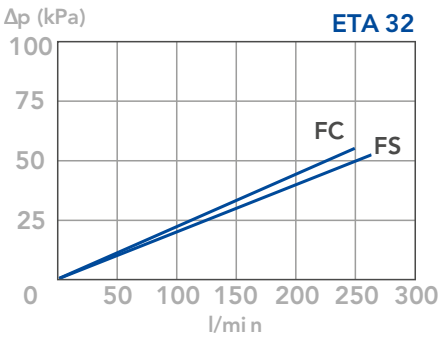


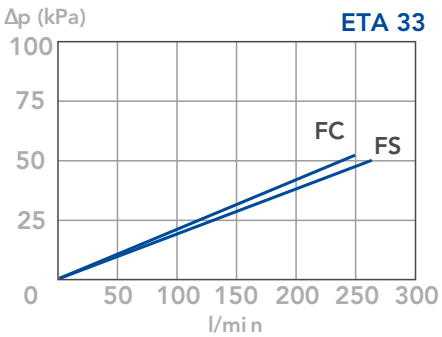


CLEAN FILTER ELEMENT PRESSURE DROP
(depending both on the internal diameter of the element and on the filter media)





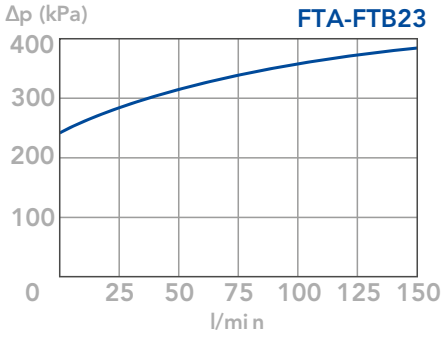


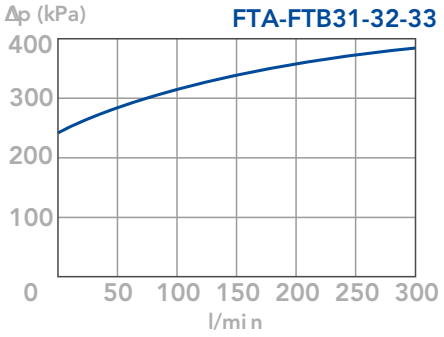


FTA-FTB-KTS
TRANSMISSION FILTERS

BYPASS VALVE PRESSURE DROP

When selecting the filter size, these curves must be taken into account if it is foreseen that any flow peak is to be absorbed by the bypass valve, it also must be of proper configuration to avoid pressure peaks. The valve pressure drop is directly proportional to fluid specific gravity.





N.B.

All the curves have been obtained with mineral oil having a kinematic viscosity 30 cSt and specific gravity 0,86 kg/dm3; for fluids with different features, please consider the factors described in the first part of this catalogue. All the curves are obtained from test done at the UFI HYDRAULIC DIVISION Laboratory, according to the specification ISO 3968.
In case of discrepancy, please check the contamination level, viscosity and features of the fluid in use.

AIR FILTERS

AIR FILTRATION LINE

Application:
Air breathers / air filters should be fitted to the top of the tank-reservoir to protect against an ingress of contamination from the atmosphere. The “breather” (with or without filler-cap) forms a barrier between the air exiting and entering the free-air space above the level of hydraulic oil in the tank-reservoir.
The air-breather represents one of the most important anti-contamination methods in a modern day hydraulic system.

User Benefits:
- System protection from airborne particulate contamination and humidity.
- Direct-mounting to the tank-reservoir avoids additional piping.
- Available with lockable oil-filler-cap to prevent unauthorized access to the tank.

CBA-TM
AIR FILTERS

DESCRIPTION

Air breather, hand mounting

MATERIALS

Housing, flange and basket: zinc plated steel
Cap: chrome plated
Filter element ((not replaceable):
Impregnated cellulose 3µm (Filtration degree in air)
Polyurathan foam 10µm (Filtration degree in air)

COMPATIBILY (ISO 2943)

Full with fluids HH-HL-HM-HV-HTG (according to ISO 6743/4). For fluids different than the above mentioned, please contact our Customer Service.

AIR SENTRY
AIR FILTERS

DESCRIPTION

Air dryer filter breathers

MATERIALS

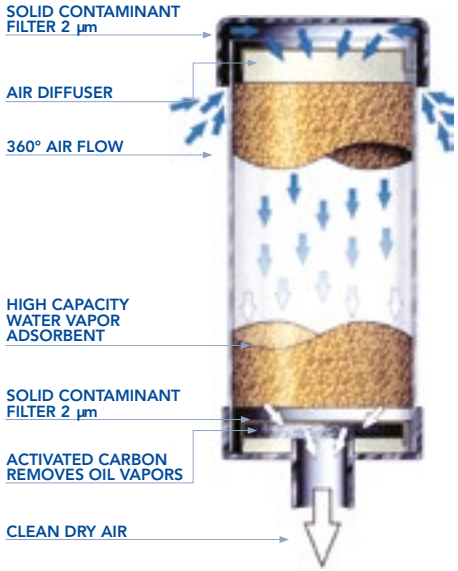
D-10+ are manufactured from rugged ABS plastic and impact-modifi ed Plexiglas.
R-10+ have a rugged steel reinforced base for heavy duty applications

TECHNICAL DATA

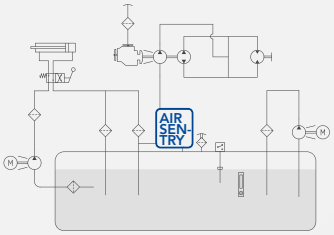
Nominal air flow rate: 1.000 l/min
Solid contaminant filtration: 2µm
Silica gel adsorption: up to 40% of its weight in water

WORKING TEMPERATURE

From -30°C to +100°C



HYDRAULIC DIAGRAM



Is this datasheet the latest release? Please check on our website.

AIR SENTRY
AIR FILTERS

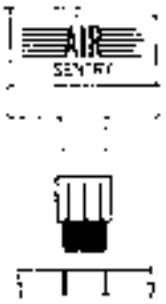
CONNECTION TO THE RESERVOIR

The breathers D10+ can be attached to the reservoir by using an adapter :

- mod. A-102 for mounting in a threaded hole 1”
- mod. A-104 for bayonet mounting on a standard flange pattern (6 holes on 73 mm PCD)

The breathers R10+ are attached to the re-servoir by 1” NPT male pipe thread.

Adapter A-102
threaded 1” NPT



Adapter A-104
bayonet for
standard flange

INSTALLATION DRAWING

Air Sentry Breathers use a three-stage filtration design to ensure optimum protection by removing water vapor and solid contaminants before they enter the fluid system.

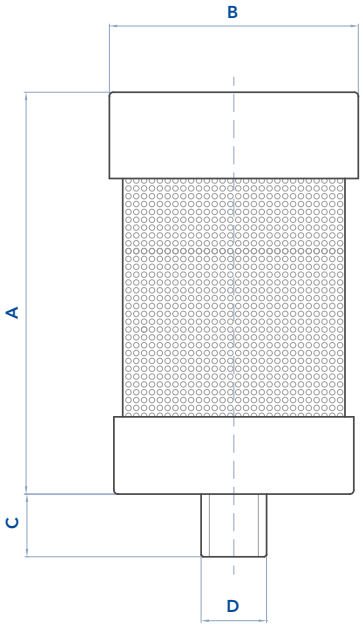
First, air passes through a fine, 2µm solid particle filter. The air then passes through a diffuser to ensure maximum effectiveness within the silica gel chamber.

Next, water vapor is removed as the air travels through a bed of silica gel, the highest capacity adsorbent available. After being dried, the air passes through a second 2µm solid particle filter and enter the reservoir, clean and dry.

Air entering is cleaned and dried. Expelled air partially regenerates the silica gel and backflushes the particulate filter to prolong the life of the breather.

Silica gel is chemically inert, non-toxic, non-deliquescent and non-corrosive. The internal structure is composed of inerconnected microscopic pores that adsorb up to 40% of its weight.

When maximum adsorption is reached, the silica gel turns from yellow to blue to indicate that replacement of the breather is required.



DIMENSIONS

R-101	140	132	25	1"NPT	1,5	0,2
R-102	216	132	25	1"NPT	2,1	0,5

ACCESSORIES

COMPREHENSIVE CHOICE, HIGH QUALITY STANDARD

Application:
UFI hydraulic accessories programme has been carefully designed to offer a range of components suited to the demands of building hydraulic systems in most industrial and mobile applications.
Whether you require simple filler breathers or precise electrical level switches, the accessories range should provide you with the choice you need.

User Benefits:

- Tank breather filters for the filtration of the incoming air to the tanks of hydraulic systems
- Tank filler and breather filter for the filtration of the incoming air to the tanks of hydraulic systems and for filling the oil on the hydraulic tank
- Filler caps for filling oil in the hydraulic tanks
- Visual and electrical level indicators of fluid for hydraulic tank
- Oil bath air filters for prolonged use in particularly dusty environments, to ensure an excellent level of filtering and a long working life. For very dusty environments can be provided with cyclone prefiltering

CFA-TM
ACCESSORIES

DESCRIPTION

Filling breathers

FILLING BREATHERS

Filling plugs with inbuilt air breather; flanged tank connection with standard dimensions; protection basket against ingression of coarse parts (removable for CFA23); zinc plated steel body and chrome plated steel cap; seals by cork (NBR - Nitrile for pressurized version only).

FILTER ELEMENT

Filter element (not replaceable):
Impregnated cellulose 3µm (filtration degree in air)
Polyurathan foam 10µm (filtration degree in air)

For sizes CFA21 & CFA22 only the plug has a safety chain.

CLA-LS
ACCESSORIES

DESCRIPTION

Visual level indicators

MATERIALS

Transparent part: Trogamid T
Anti-shock protection: Painted steel
Fixing bolts: zinc plated steel
Seals: NBR Nitrile
(FKM - on request fluoroelastomer)

Double scale thermometer
(Celsius and Farenheit) option available.
Tightening torque for the fixing bolts 10 Nm

PRESSURE

Max pressure allowed 100 kPa (1 bar)

WORKING TEMPERATURE

From -20°C to +90°C

CLB-LME
ACCESSORIES

DESCRIPTION

Float switches

FLOAT SWITCHES

Electrical level indicators, an electrical signal is activated when the minimum (or maximum) oil level is reached. The REED switch has SPDT contacts.

N.B. the float switch must be mounted at min 50 mm from ferrous walls. Max oil viscosity 150 cSt.

MATERIALS

Tank connection: Anodized aluminium
Rod: Stainless steel
Float: Polyammide

COMPATIBILITY (ISO 2943)

Full with fluids HH-HL-HM-HV-HTG (according to ISO 6743/4). For fluids different than the above mentioned, please contact our Customer Service.

WORKING TEMPERATURE

From -10°C to +90°C

FAB
ACCESSORIES

DESCRIPTION

Oil bath air filter and cyclone prefilter
Ports: ø 57 - 65 - 93 - 114
Flow rate: 3.000 to 12.000 l/min

MATERIALS

Housing: black painted steel
Internal parts: steel
Filter element: zinc painted steel
(stainless steel on request)
Prefilter transparent housing and buffle: plastic material
Seals: NBR

WORKING TEMPERATURE

Max working temperature: 95°C

CLOGGING INDICATORS

THE IMPORTANCE OF GETTING THE TIMING RIGHT

Application:
The most economic change-out time for the filter-element requires a mechanism to monitor the pressure of the hydraulic oil flowing through the filter, and one which alerts the user when this flow starts to diminish.
This is the most likely indication that the filter element contains excessive particulate contamination.
Both the visual clogging indicator and the electrical clogging indicator must be set to trigger a signal at a pressure lower than the setting of the integrated by-pass valve in the filter.

User Benefits:
- Lightweight and compact. Direct mounting to the filter-head.
- Sealed, robust casing to protect the electrical parts (IP69K). Resistant to adverse environmental conditions (ISO 15003).
- Reliable signal prior to by-pass operation ensures timely filter-element replacement and avoidance of potential system contamination.

FILTRATION IN BRIEF

FILTRATION IN BRIEF

Contamination Control in the hydraulic system is a very wide and complex matter; the following is just a short summary.
Our Customer Service is at your disposal for any further information.
The function of the fluid in the hydraulic systems is transmitting forces and motion.
In view of a reliable and efficient operation of the system, it is very important to select the fluid considering the requirements of the system and the specific working conditions (working pressure, environment temperature, location of the system, etc.).
Depending on the required features (viscosity, lubricant capacity, anti-wear protection, density, resistance to ageing and to thermal variances, materials compatibility, etc.), the proper oil can be selected among a number of mineral oils (the most popular), synthetic fluids, water based fluids, environmental friendly fluids, etc.
All the hydraulic fluids are classified according to international standards.
Solid contamination is recognized as the main reason for malfunction, failures and early decay in hydraulic systems; it is impossible to eliminate completely it, but it can be well kept under control with proper devices (filters).
No matter which fluid is used, it must be kept at the contamination level required by the most sensitive component used on the system.

HOW THE CONTAMINATION IS MEASURED

The contamination level is measured by counting the number of particles of a certain dimension per unit of volume of the fluid; this number is then classified in Contamination Classes, according to international standards.
Measuring is made with Automatic Particle Counters that can make the analysis on line (through sampling connectors put on the system for this purpose) or from sampling bottles.
The calculations and sampling of the fluid must be done according to the specific ISO norms, to attest their validity.
The most popular standard for Contamination Classes in the hydraulic systems is ISO 4406; the standard NAS 1638 (under revision) is also quite used.

CONTAMINATION CLASSES ACCORDING TO ISO 4406

The Contamination Class according to this standard is described by 3 numbers indicating the number of particles per 100 ml of fluid having bigger size than 4, 6 and 14 µm(c) respectively.

ISO Code	Number of particles per 100 ml more than	up to
22	2.000.000	4.000.000
21	1.000.000	2.000.000
20	500.000	1.000.000
19	250.000	500.000
18	130.000	250.000
17	64.000	130.000
16	32.000	64.000
15	16.000	32.000
14	8.000	16.000
13	4.000	8.000
12	2.000	4.000
11	1.000	2.000
10	500	1.000
9	250	500
8	130	250

ISO Code 21/18/15	**21®**	**≥ 4 µm(c)**
ISO Code 21/18/15	**18®**	**≥ 6 µm(c)**
ISO Code 21/18/15	**15®**	**≥ 14 µm(c)**

The above Contamination Class describes a fluid containing:
- between 1.000.000 and 2.000.000 particles ≥ 4 µm(c) per 100 ml
- between 130.000 and 250.000 particles ≥ 6 µm(c) per 100 ml
- between 16.000 and 32.000 particles ≥ 14 µm(c) per 100 ml

FILTERS AND FILTER MEDIA

All the hydraulic systems have an initial solid contamination, tending to increase during operation due to component wear, ingression from seals, etc. For this reason it is necessary to use filters that retain the contaminant and allow the fluid to reach and maintain the required contamination class.
Depending on their location into the system, the most common filter types are:

- RETURN FILTERS, downstream from all the components, filtering the oil before it returns into the tank. Their function is keeping the required contamination level inside the tank (indirect protection of the components) and must be sized to have a high dirt holding capacity (i.e. a long life). They usually have filter elements by glassfiber (absolute filtration, ßx ≥ 75) or by cellulose (nominal filtration, ßx ≥ 2)
- IN LINE FILTERS, on the pressure line, protecting directly one or more components, ensuring they are fed with oil having the proper contamination class. They usually have filter elements by glassfiber (absolute filtration, ßx ≥ 75) sometime by cellulose (nominal filtration, ßx ≥ 2)
- SUCTION FILTERS, on the suction line, protecting the pump from possible coarse contamination. They usually have filter elements by metal wire mesh (geometric filtration) and must be sized properly, to avoid any possible pump cavitation.

Good AIR FILTERS (breathers), filtering the air drawn into the tank when the oil goes to the actuators, must be used to avoid contaminant ingression from the environment. When a very low contamination class is required (i.e. very good cleanliness) it can be necessary to use a OFF-LINE FILTER, that operates at steady flow rate and pressure, thus getting the highest filtration efficiency. Even the new oil has always a certain solid contamination, so it is a good rule to make any filling or refilling of the system by using a FILTRATION UNIT.

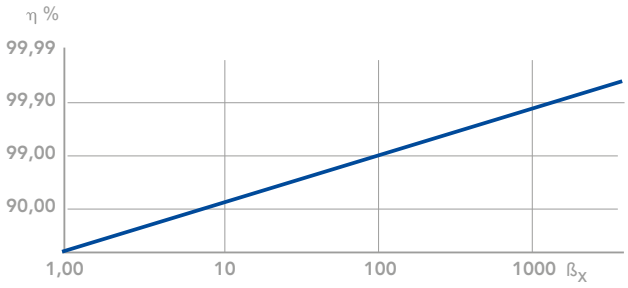
HOW TO MEASURE THE FILTRATION EFFICIENCY

BETA RATIO

$ß_x = (n_{in} = X\ µm) : (n_{out} = X\ µm)$

where "n" is the number of particles = x µm
upstream and downstream from the filter.

E.g. if you have 100.000 particles = 10µm upstream and 1.000 particles downstream:
$ß_{10}$ = 100.000 : 1.000 = 100



FILTRATION EFFICIENCY η(%):

η = 100 - (100 : ß)

i.e.
$ß_x$ = 2 means = 50,00 %
$ß_x$ = 20 means = 95,00 %
$ß_x$ = 75 means = 98,67 %
$ß_x$ = 100 means = 99,00 %
$ß_x$ = 200 means = 99,50 %
$ß_x$ = 1.000 means = 99,90 %

FILTRATION IN BRIEF

REFERENCES FOR THE "BETA" RATIO

The standard ISO 16889 has replaced since 1999 the former ISO 4572 concerning the Multi-Pass test, stating the Beta value of a filter element.
The current standard considers the test dust ISO MTD instead of the ACFTD formerly used, both in the Multi-Pass test rigs and for the calibration of the automatic particle counters.

In the ISO 16889 the particles sizes are measured in a different way than in the ISO 4572.
To avoid any confusion, when micron are measured according to the current spec they are indicated as **µm$_{(c)}$**.

Depending on the measuring method, the reference Beta values of the UFI filter media are as follows:

UFI MEDIA	SOFIMA MEDIA	$ß_{x(c)} > 1000$ (ISO 16889)	$ß_x > 200$ (ISO 4572)
FA	FT	5 µm$_{(c)}$	3 µm
FB	FC	7 µm$_{(c)}$	6 µm
FC	FD	12 µm$_{(c)}$	12 µm
FD	FV	21 µm$_{(c)}$	25 µm

N.B.
The contamination classes achieved (i.e. the performances on the field) as well as the pressure drop values **are unchanged.**

FILTER MEDIA AND CONTAMINATION CLASSES

Each hydraulic components manufacturer specifies the contamination class required for the best performance and life of their components.

To achieve the required contamination class, the proper UFI filter media must be chosen according to this table:

Typical application	Aeronautic, test rigs.	Aeronautic, ind. Robotics	Ind. robotics, precision machine tools	High reliability ind. machines, Hydrostatic transmissions	Industrial machines, earth moving machines	Mobile machines	Machines for heavy industry	Machines for agriculture systems not continuos service
Pumps and/or motors	-	Piston, variable > 21 Mpa	Piston, variable < 21 MPa Vane, variable > 14 Mpa	Pist./vane, variable < 14 MPa Pist./vane, fIxed > 14 Mpa	Pistons, fixed < 14 Mpa Vane, fixed > 14 Mpa	Vane, fixed gear > 14 Mpa	Vane, fixed gear < 14 Mpa	Vane, fixed gear < 14 Mpa
Valves	Servovalves > 21 Mpa	Servovalves < 21 MPa Proportional > 21 Mpa	Proportional < 21 MPa Cartridge > 14 Mpa	Cartridge < 14 Mpa	Solenoid > 21 Mpa	Solenoid < 21 Mpa	Solenoid > 14 Mpa	Solenoid > 14 Mpa
Contamination class ISO 4406	15/13/10	16/14/11	17/15/12	18/16/13	19/17/14	20/18/15	21/19/16	22/20/17
Recommended UFI filter media	**FA** $ß_{5(c)} > 1.000$	**FA - FB** $ß_{5(c)} > 1.000$ $ß_{7(c)} > 1.000$	**FB** $ß_{7(c)} > 1.000$	**FB - FC** $ß_{7(c)} > 1.000$ $ß_{12(c)} > 1.000$	**FC - FD** $ß_{12(c)} > 1.000$ $ß_{21(c)} > 1.000$	**FD** $ß_{21(c)} > 1.000$	**FD - CC** $ß_{21(c)} > 1.000$ $ß_{10} > 2$	**CC** $ß_{10} > 2$

N.B. NAS 1638 is officially inactive for new designs after May 30, 2001.

REAL FLOW RATE THROUGH THE FILTER

In order to size properly the filter, it is essential to calculate the REAL flow rate of the oil passing through it:

- IN SUCTION AND PRESSURE FILTERS the flow rate is usually the same as the pump delivery (with the exception of the FPD01 and 12 series, where the flow rate is just the one required by the pilot valve)
- in RETURN FILTERS it is necessary to calculate the maximum possible flow rate, taking in account any possible additional return line, cylinder and accumulator. If such data are unknown, as a good rule a flow rate at least 2 ÷ 2,5 times the pump delivery should be considered.

Filter element life is significantly effected by the pollution level at the machine location and by the maintenance level of the machine. Considering these parameters the actual flow rate should be multiplied by the following "Environmental Factor":

ENVIRONMENTAL FACTOR

System maintenance level	Environment contamination level		
	LOW	MEDIUM	HIGH
• tank with good protection, efficient air breathers • few actuators, with very good protection from contaminant ingression • frequent monitoring of filter conditions	1	1	1,3
• tank with protection, good air breathers • many actuators, with good protection from contaminant ingression • scheduled monitoring of filter conditions	1	1,5	1,7
• tank with poor protection • many actuators, with low protection from contaminant ingressions • random monitoring of filter conditions	1,3	2	2,3
	F. i. system located in climatized room	F. i. system located in industrial building	F. i. system located in hostile environment (foudry, wood workingmachines, mobile machines)

PRESSURE DROP (Δp)

After having stated the filter media and the REAL flow rate, the filter must be chosen from the "flow rate tables" in the catalogue.
The values shown there take in account the pressure drop Δp met by the fluid passing through the filter, that must be within a certain value.
In practice, the "assembly Δp" (Δp filter housing + Δp filter element) with clean filter element should be:

- 3 kPa (0,03 bar) max for suction filters
- 35 ÷ 50 kPa (0,35 ÷ 0,5 bar) max for return filters
- 35 ÷ 50 kPa (0,35 ÷ 0,5 bar) max for pressure filters < 11 MPa (110 bar)
- 80 ÷120 kPa (0,80 ÷1,2 bar) max for pressure filters > 11 MPa (110 bar)

Lower initial pressure drop provides better filter efficiency and longer filter element service life.

N.B. The flow rate values given in the tables are referred to mineral oil with kinematic viscosity "V" of 30 cSt and density "ps" = 0,86 Kg/dm^3.
When using oils with different features, the following correction factors must be applied at the Δp_0 values obtained on the curves:
FILTER HOUSING
the pressure drop is directly proportional to the oil density "ps", so in case you have $ps_1 \neq 0,86$ ► $\Delta p_1 = (\Delta p_0 \times ps_1) : 0,86$
FILTER ELEMENT
the pressure drop through the filter element varies in function of the kinematic oil viscosity, so in case you have a kinematic viscosity V_1 (cSt) different from cSt:
- for kinematic oil viscosity ≤ 150 cSt ► $\Delta p_1 = \Delta p_0 \times (V_1 : 30)$
- for kinematic oil viscosity > 150 cSt ► $\Delta p_1 = \Delta p_0 \times [V_1 : 30 + \sqrt{(V_1 : 30)}] : 2$

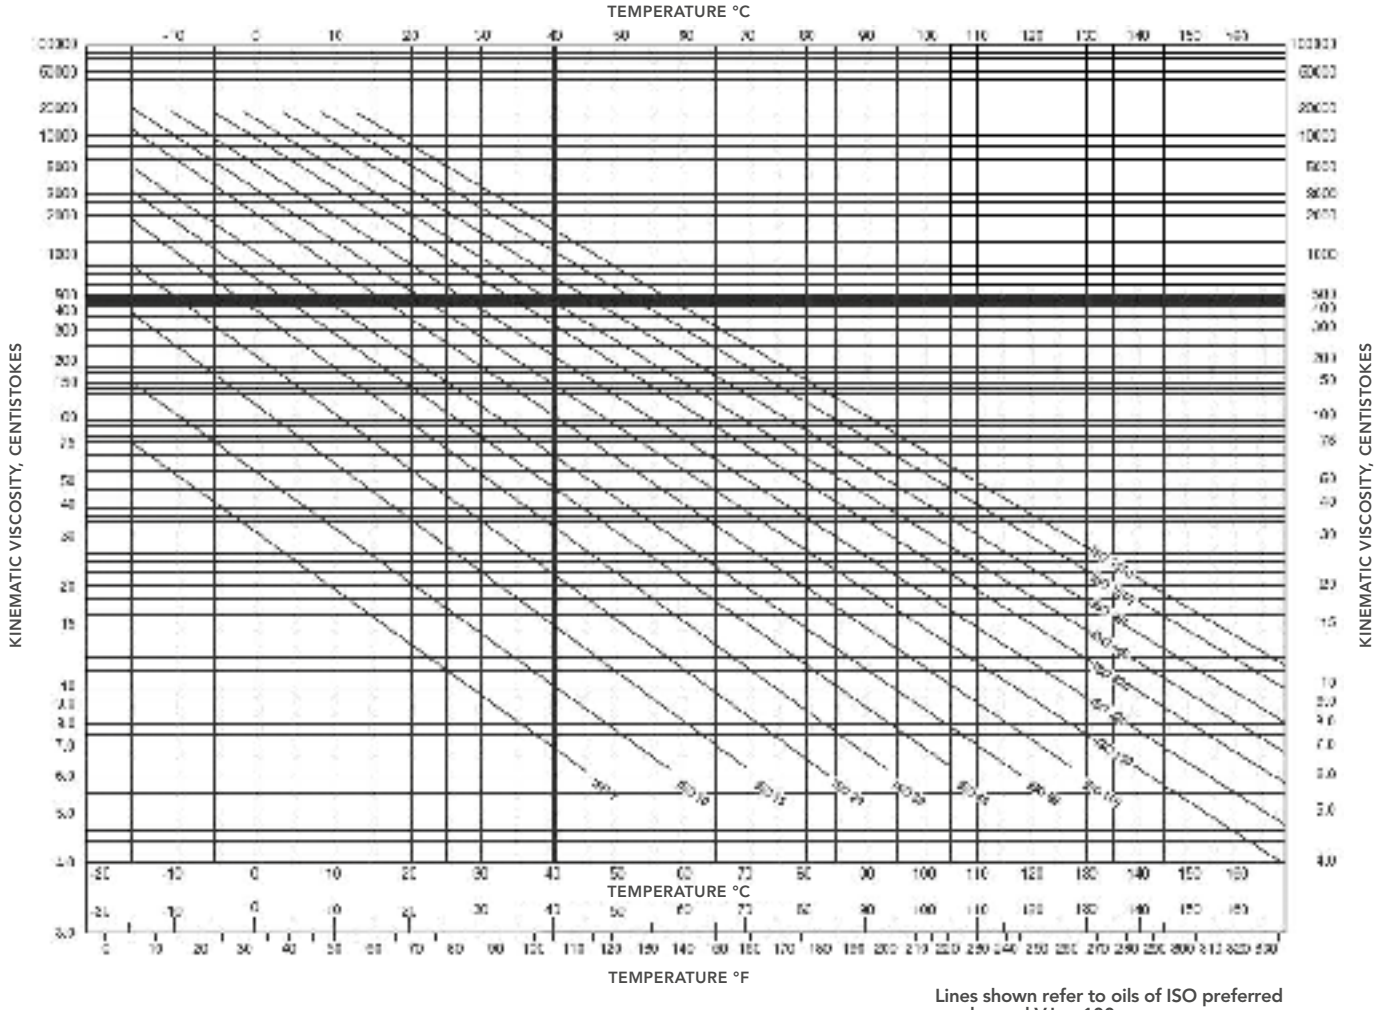
(for more details about kinematic oil viscosity see the diagram on the next page)
Some fluids have filterability problems (difficulty in passing through a "multilayer" (glassfiber) filter media).
In such cases a correction factor must be considered when sizing the filter: this factor must be verified with the filter manufacturing, specifying all the features of the fluid.
It is a good rule, when sizing the filter, to consider also the max recommended fluid speed:
in suction lines 0,1< v < 1 m/s | in return lines 1,5< v < 4 m/s | in pressure lines 5< v < 10 m/s

FILTRATION IN BRIEF

CLOGGING INDICATOR

During the system operation, the pressure drop through the filter increases as the element clogs, due to the contaminant retained.
The filter element must be replaced when clogged and anyway before the pressure drop reaches the bypass valve set value.
For this reason it **is recommended a clogging indicator on the filter. It gives a visual or electrical indication and must have a set value lower than the bypass valve set value**, to get an exact indication of the right time for filter element replacement.
On return and low pressure filters the clogging indicator can be a **pressure gauge** or a **pressure switch**, measuring the pressure upstream the filter. On some return filters and on **high pressure filters**, the clogging indicator can be of **differential** type: measuring the pressure upstream and downstream the filter and activating a signal when the differential pressure reaches the set value.
On **suction filters** the clogging indicator is a **vacuum gauge** or a **vacuum switch**, measuring the depressure downstream the filter.
All the **UFI** filters have the port for the indicator as a standard feature; if the filter is ordered without indicator the port is plugged with a removeable plug allowing the indicator to be added easily at any time.

VISCOSITY VS TEMPERATURE



Lines shown refer to oils of ISO preferred grades and V.I. = 100.
Lower V.I. oils will show steeper slopes.
Higher V.I. oils will show flatter slopes.

ISO FLUIDS CLASSIFICATION AND COMPATIBILITY WITH MATERIALS

The table here gives some general indication of fluid classification (ref. ISO 6743) and their compatibility; we recommend to verify the exact features of the fluid with the supplier.

ISO ref.	Type of fluid	Features	Compatibility (10th digit in ordering code)
HH	Mineral base fluid	No additives	N
HL	Mineral base fluid	Anticorrosion, antioxidation add.	N
HM	Mineral base fluid	Antiwear additives	N
HV	Mineral base fluid	Viscosity improver additives	N
HFA	Fire extinguishing fluid	Oil in water emulsion (water >90%)	G (aluminium and zinc not compatible)
HFB	Fire extinguishing fluid	Water in oil emulsion (water >40%)	G (aluminium and zinc not compatible)
HFC	Fire extinguishing fluid	Water glycol	G (aluminium and zinc not compatible)
HFD	Fire extinguishing fluid	Synthetic fluid (phosforic ester)	F (NBR not compatible)
HTG	Environmentally accepted fluid	Vegetal base fluid	N
HPG	Environmentally accepted fluid	Glycol base synthetic fluid	G (aluminium and zinc not compatible)
HE	Environmentally accepted fluid	Esther base synthetic fluid	F (NBR not compatible)

The filter element can be considered as the processor within the filtration computer, that's why extensive knowledge and a many years of manufacturing expertise make significant difference in the design and development of filter element performances and reliability.
Hydraulic filter elements normally use one of three different types of media :

- Metal wire mesh: it is a surface filter and it gives a geometrical filtration. It's rating is determined as "Largest diameter of hard spherical particle that will pass through the media";
- Cellulose (paper impregnated with resin): it is a depth filter media with a irregular structure. It's classified on average pore dimension.
- Microfiber (inorganic fiber impregnated with resin): it is a depth filter media with regular structure. It's classified on average pore dimension and it consists of multiple layers
- Thanks to the multilayer structure with differential porosity the microfiber media retains even smaller particle sizes than the reference filtration ratio of each filter media.

FILTRATION IN BRIEF

The actual retention capacity behaviour is described in the graph here below:
